

SGE Revisions: July 18, 2008

Revisions are specific to Sections 300 and 500, as follows:

Section 300 was revised to clarify drilled boring location, spacing, depth, and sample interval requirements. Borings were given boring type identifications (Type A, B, C, etc.), and the description was changed to a location, spacing, depth, and sample interval sequence as best as possible. Tables presenting this information have been created and will be included as an appendix in the near future. No specifications were changed. Also, a couple of section references were incorrect, therefore, they were corrected.

Chapter 500 was revised to clarify what an open standpipe piezometer is versus a monitoring well. They were basically switched.

One last grammatical change, "borehole" was changed to "boring" throughout the document.
