Date: May 12, 2017
Project ID: 25596
Floodplain Affected: Mud Run at I.R. 71

Description of Project:
The existing set of twin bridges are to be rehabilitated by replacing the bridge deck edges and parapets, replacing approach slabs and abutments above the existing footers. In addition, the existing deck will be overlaid with latex modified concrete.

Why must this project be located in the Floodplain?
This is a rehabilitation on a pre-existing set of bridges.

What alternative sites were considered, if any?
No other alternatives were considered since the scope of work was to rehabilitate pre-existing bridges.

Were any mitigation measures utilized on this project? If so, please describe.
No permanent fill is being placed within the floodplain, and the hydraulic opening is not being reduced due to the proposed scope of work.

To the best of my knowledge, this project has complied with all applicable Local, State, and Federal Floodplain protection standards.
