Construction Inspection Documentation Forms

Introduction

The Ohio Department of Transportation is devoted to maintaining high levels of project inspection and documentation across the State. The forms and instructions contained herein are provided to project personnel to assist in the proper determination of compliance with the provisions of the contract, the measurement of quantities for payment, and the documentation of compliance and measurements.

In no instance does this document alter the provisions of the contract.

These procedures will be used to provide a uniform and fair basis of operations wherever the Ohio Department of Transportation provides supervision or engineering services for the acquisition, construction, or maintenance of materials or services. This is not a contract document, and is not to be construed in any way to obligate the Ohio Department of Transportation to perform any duties. These forms should be used in conjunction with the Construction Inspection Manual of Procedures.

Reference Documents

Documents normally used for detailed interpretation of substantiation requirements, practices, and test methods are:

1. Ohio Manual of Uniform Traffic Control Devices
2. Sampling and Testing Manual, Testing Administration Manual
3. Traffic Engineering Manual
4. Construction Inspection Manual of Procedures

Other documents may also be used as they are developed and published.

More testing forms (those beginning with TE) can be found online here:

http://www.dot.state.oh.us/Divisions/ConstructionMgt/Materials/Pages/TE_Forms.aspx

Districts are permitted to customize forms as long as ***all*** of the data listed on the standard forms published here is also included on the modified forms.

Many of these forms are available in Excel format with automated calculation fields. They can be found online here:

http://www.dot.state.oh.us/Divisions/ConstructionMgt/Admin/Pages/InspectionForms.aspx

Instruction Codes

The following instructions, grouped by measurement type, supplement the general instructions and have particular application to specific pay items. Match the Instruction Code listed in the Index of Pay Items tables (starting on page 4) to the following Instruction Codes to determine specific documentation requirements. Special and unlisted pay items will be documented using the guidelines outlined in the Construction Inspection Manual of Procedures.

Instruction Code	Description
	Conversion Type Measurements
C-1	Summarize the final weight to nearest ton (metric ton) from validated weight tickets and determine the final volume to the nearest cubic yard (cubic meter) by using conversion factor.
C-2	Summarize and convert to nearest ton (metric ton) for the final quantity by conversion from validated tickets. Convert sack and brine shipments to weight as specified.
C-3	Summarize the final quantity to nearest cubic yard (cubic meter) by conversion from validated weight tickets. Include a daily coordination of weight tickets with placement and location. Where there is a moisture limitation, at least one moisture test must be made (more if necessary) to provide for an appropriate deduction.
C-4	Determine volume to nearest gallon (liter) by conversion from validated weight tickets. Where source validation is missing, or for partial loads, determine volume by conversion from weigh-back or by measurement of tank. Where basic measurement is by volume, record temperature.
C-5	Determine the final quantity to nearest cubic yard (cubic meter) from plan quantity adjusted for errors and changes. Use for new construction on new subgrade. For variable thickness or resurfacing determine quantity to nearest cubic yard (cubic meter) by conversion from validated weight tickets.
C-6	For direct volume measurements determine volume to nearest cubic yard (cubic meter) from cross-sections before and after removal. For converted volume measurements, summarize validated weight tickets and convert to nearest cubic yard (cubic meter) using density tests as basis for conversion. Adjust measured quantity by deducting embankment in excess of allowable tolerances, if any, in accordance with the Earthwork Construction section of this manual.
C-7	Determine the area by field measurement to nearest square yard (square meter). Substantiate rates of application by means of at least one test area made at time of application. Determine rate of application on test area by calculation from verified quantities of material placed and measured in the area over which it is applied. For seeding and mulching, record number of square yards (square meters) having substantiated rates of application.
	Volume Type Measurements
V-1	Determine volume to nearest cubic yard (cubic meter) using recorded verified plan dimensions, which include a verification of depth and thickness.
V-2	Record verified plan dimensions of the forms and calculate the volume of each unit. Summarize the final quantity to the nearest cubic yard (cubic meter) or decimal as indicated by the estimated bid quantity (Ref. No.).
V-3	Determine the volume before removal or determine the volume from verified plan dimensions to the nearest cubic yard (cubic meter).
V-4	Plan quantity must be paid as per specification 203.09. Any plan changes must be documented using cross-sections per C-6 or measurements per V-1.
V-5	Determine the volume loose in a vehicle at the point of delivery and summarize to the nearest cubic yard (cubic meter).
V-6	Determine the volume to the nearest cubic yard (cubic meter) using specified dimensions and vertical measurements between bottom plane of footing and top of rock or shale excavation.
V-7	Determine the volume to the nearest cubic yard (cubic meter) from summarization of validated delivery tickets. Tickets must record cubic yard (cubic meter) from predetermined tank size or sizes, converted weight, or meter readings. Tickets for each load must be issued by the contractor and must be collected, identified, and validated by the inspector at the point of delivery.
V-8	Determine the volume to the nearest cubic yard (cubic meter) by using horizontal dimensions established by 503.10 of the specifications.
	Weight Type Measurements
W-1	Summarize the weight to the nearest 100 pounds (50 kilograms) by using validated scale weight tickets or weights calculated from the verified dimensions and steel handbook.
W-2	Obtain a copy of a memorandum from the Office of Structural Engineering for approved pay weights. See structural steel screen on CMS (SSREF).
W-3	Summarize the validated delivery tickets to the nearest ton (metric ton). Determine the volume of the embankment, if any, in excess of the allowable tolerances, convert to tons (metric tons), and deduct from the summarized weight.
W-4	Summarize to the nearest ton (metric ton) from the validated weight tickets.
W-5	Summarize to the nearest pound (kilogram) from the validated weight tickets.
	Linear Type Measurements
L-1	Measure the length of the item and summarize to the nearest foot (meter).
L-2	Measure the length of an item to the nearest foot (meter), include data as to its re-use and storage.
L-3	Measure the length of the item to the nearest 1/100th mile (1/100 kilometer, e.g. 19.98 kilometer), etc.
L-4	Measure the length to the nearest 0.1 ft (0.1 meter, e.g. 14.8 meter), etc.
L-5	Guardrail quantities are normally determined in standard 12 feet 6 inch (3.81 meter) panel lengths with adjustments for end assemblies, in multiples of 6.25 feet (1.905 meter).
L-6	Measure the length of an item to the nearest 1/100th mile (1/100 kilometer, e.g. 19.98 kilometer), etc. and include deficiency data as per the specifications.
L-7	Measure the length of piles between extreme point and cut-off to the nearest 0.1 ft (25 millimeters). Measure the inside of cast-in-place piles and make a conformance statement relative to the measurement and length marks. Summarize the measurements to the nearest foot (meter). Locate the piles by use of the numbering system on the piling layout.
L-8	For items 603 and 605 measure the length of the item and round up to the next foot (0.5 meter).
	Area Type Measurements
A-1	Measure the surface dimensions of the item, calculate the area, and summarize to the nearest square yard (square meter).

A-2	Adjust the plan area for changes, errors, and deviations in excess of the allowable tolerances, and summarize to the nearest square yard (square meter).
A-3	Determine the specified plan areas of each size and type from verified shop drawings and summarize to the nearest 1/10 square yard (1/10 square meter).
A-4	Plan quantity as per specification 659.24. Check application rates and deduct area if the application rates are below specifications for seed, mulch, and emulsion.
	Unit (each) Type Measurements
U-1	Determine the number of units.
U-2	Determine the number of units visible on completion and make a statement relative to the conformance with the contract requirements.
U-3	Determine the number of units and include the data as to reuse or storage or disposal by Contractor.
	Lump Sum Type Measurements
LS-1	Verify that the work is in accordance with the plans.
LS-2	Record driving log of first test pile or the results of the test loads and locate by use of the numbering system on the piling layout.
	Miscellaneous Type Measurements
M-1	Summarize the final rolling time to the nearest hour. Include the data on weight and tire pressure.

Earthwork (200)

ITEM	DESCRIPTION	UNITS Required Accuracy Daily Entries	CODE	FORM	TKTS
201	**Clearing and Grubbing**				
201	trees or stumps removed, _____ size	each	U-1	CA-D-1A/1B or 3	
201	clearing and grubbing	lump	LS-1	CA-D-3	
202	**Removal of Structures and Obstructions**				
202	structures removed	lump	LS-1	CA-D-3	
202	portions of structures removed	lump	LS-1	CA-D-3	
	portions of structures removed	1 yd^3	V-3	CA-D-1A/1B weight	X
	portions of structures removed	100 pound	W-1		
202	pipe removed for reuse or storage	1 foot	L-2	CA-D-1A/1B or 3	
202	pipe removed	1 foot	L-1	CA-D-1A/1B or 3	
202	pavement removed	0.1 yd^2	A-1	CA-D-1A/1B	
202	wearing course removed	0.1 yd^2	A-1	CA-D-1A/1B	
202	base removed	0.1 yd^2	A-1	CA-D-1A/1B	
202	walk removed	0.1 yd^2	A-1	CA-D-1A/1B	
202	steps removed	lump	LS-1	CA-D-3	
202	curb removed	1 foot	L-1	CA-D-1A/1B or 3	
202	curb and gutter removed	1 foot	L-1	CA-D-1A/1B or 3	
202	gutter removed	1 foot	L-1	CA-D-1A/1B or 3	
	gutter removed	0.1 yd^2	A-1	CA-D-1A/1B	
202	curb removed for storage	1 foot	L-2	CA-D-1A/1B or 3	
202	precast traffic dividers removed for re-use and storage	each	U-3	CA-D-1A/1B or 3	
202	buildings demolished	lump	LS-1	CA-D-3	
202	underground storage tank removed	each	U-1	CA-D-3	
202	regulated storage tank removed	each	U-1	CA-D-3	
202	septic tank removed	each	U-1	CA-D-3	
202	privy vault removed	each	U-1	CA-D-3	
202	guardrail removed	1 foot	L-1	CA-D-2 or 3	
202	guardrail removed for re-use or storage	1 foot	L-2	CA-D-2 or 3	

ITEM	DESCRIPTION	UNITS Required Accuracy Daily Entries	CODE	FORM	TKTS
202	fence removed for re-use or storage	1 foot	L-2	CA-D-2 or 3	
202	rpm's removed for disposal by contractor	each	U-3	CA-D-2 or 3	
202	manhole removed	each	U-1	CA-D-3	
202	manhole abandoned	each	U-1	CA-D-3	
202	catch basin of inlet removed	each	U-1	CA-D-3	
202	catch basin or inlet abandoned	each	U-1	CA-D-3	
203	**Roadway Excavation and Embankment**				
203	excavation	1 yd^3	V-4	CA-EW-1 CA-D-3

CA-S-2 Paint Thickness (QCP #5, #8, #10) (back)

Top Section: This section is used for general information.

Middle Section: This section is to help you determine how many 100 square foot areas must be tested. See CM&S 514.20

Bottom Section: This section is used to calculate and record the dry film thickness (DFT) readings on a member in a particular area. The spot averages should be compared to the minimum and maximum spot thinknesses given in the table in CM&S 514.20. The Area Averages should be compared to the minimum and maximum specified thicknesses given in the table in CM&S 514.20

CA-S-3A (BR-2-75A) Pile Driving Log Summary (back)

CA-S-4 High Performance Concrete Pre-Pour Meeting - 1/3

PROJECT: _____ DATE: _____

LOCATION: _____ TIME: _____

PRESENT:

_____

_____

_____

DRY RUN:

- Check height of rail over enddams at all four corners - *Equal heights for left rear and fwd and for right rear and fwd
- Check any change in cross-slope and discuss method of performance
    - Confirm appropriate depth of roller fins
    - Check reinforcing steel clearances

TIME AND LOCATION OF POUR:

- Date: _____ Time:_____
- Pour to begin on _____ side and commence on the _____ side
- Location of pumps, if used
- Lighting plan if at night

PLAN AND SPECIFICATION REVIEW:

- Need a written statement, from the admixture supplier verifying the compatibility of materials, a mix design, and a batching sequence
- Need successful test pour prior to concrete placement
- A technical representative is required during concrete placement
- Calendar restrictions for flyash are waived
- Need verification of vibration frequencies on finishing machine
- No rain to be forecasted during placement; if rain occurs, operations cease
- Surface evaporation rate must be equal to or less than 0.1 pound per square foot per hour DURING the pour as determined and documented by the contractor
- Vibrators shall be used
- Mix characteristics shall be adjusted off the deck before placement
- Maximum mix temperature is 90 degrees
- 7 day water cure: 1 layer of burlap with continuous water covered with plastic sheeting, apply membrane cure as per 511.19 method (b) within 12 hours of burlap removal
- Prior to opening to traffic, check top and bottom for cracks and, if necessary, reseal from the top
- Can open to traffic after membrane cure is applied, unless between October 15 and March 30, then must wait 30 days
    - Seal joints with HMWM
    - Re-apply membrane cure after grooving, unless concrete is older than 30 days

CA-S-4 High Performance Concrete Pre-Pour Meeting - 2/3

PROJECT: _____ DATE: _____

CONCRETE PLANT:

- Presoak limestone 24 hours and allow to drain overnight - *Don't charge bins with dry material
- Batching to begin at _____
- Expel all water from the mixers before loading / reloading (especially important for micro-silica mixes)
- Dissolvable micro-silica bags are not allowed
- A slow ribbon feed of cement is required
- Mix 5 minutes at plant
- Pour consists of approximately _____ C.Y.
- Time between trucks _____ minutes
- Pour _____ cy./hr.
- Radio communication with plant for mix design changes
- Haul distance: _____ minutes

QUALITY CONTROL

- High Performance Concrete
- Mix no. _____
- Proportioning and batching changes are contractor's responsibility
- W/C max = 0.40, (mix 3 and 4), based on total cementitious material
- Maximum slump = 8 inches
- Air 7% ± 2
- Flyash, unless use slag, shall be type C
- Type F or G admixture is required for workability; suggest using type A for finishing advantages
- Any admixtures added at the jobsite shall be mixed a minimum of 5 minutes
- Air and slump tests are to be taken at point of placement
- Discharge time = 90 minutes
    - No "balling" of mix, if balling occurs load will be rejected and mixing process revised

CONTRACTOR'S OPERATION

- Tools
    * broom finish
    * vibrating pan or rollers
    * straightedge
    * presoaked burlap
    * plastic for bad weather protection
    * extra vibrator

CA-S-4 High Performance Concrete Pre-Pour Meeting - 3/3

PROJECT: _____ DATE: _____

CONTRACTOR'S OPERATION (Continued)

- Concrete Placement
  - * wet deck continuously in front of placement
  - * place plastic sheeting to avoid deck contamination
  - * straightedge checking at bulkheads and enddams
  - * need 2 walk-bridges (1 for finishers and 1 for burlap)
  - * smooth finish along curbs and/or parapets only
  - * burlap shall follow as close as possible to deck overlay

PROJECT INSPECTION Personnel (If available)

- Moisture tests to be run at _____
- 1 Plant Inspector
  - * Checking aggregate moistures
  - * checking revolutions
  - * checking no wash water, no wash down water after batching
- 2 Concrete Quality Control Testers _____
  - * chase air on every truck _____
  - * Air, slump, yield
  - * Cylinders made every 200 CY.
  - * various pump, if used, configuration correlation tests
  - * make beams
  - * check concrete temperature
- 1 Concrete Quality Control Inspector _____
  - * documenting any added materials
  - * check batch tickets
  - * time from start to discharge
  - * insuring 5 minute mixing time if materials added
  - * documenting test results
  - * fill out TE-45
- 1 Placement Inspector _____
  - * make depth checks
  - * make reinforcing steel depth checks
  - * insure curing is placed ASAP

MISCELLANEOUS

- Traffic Control

CA-S-4 High Performance Concrete Pre-Pour Meeting - 3/3 (back)

CA-S-5 Micro-Silica Overlay Pre-Pour Meeting - 1/3

PROJECT: _____ **DATE:** _____

LOCATION: _____ **TIME:** _____

PRESENT: _____

_____

_____

DRY RUN:

- Check height of rail over enddams at all four corners - *Equal heights for left rear and fwd and for right rear and fwd
- Check any change in cross-slope and discuss method of performance
    - Confirm appropriate depth of roller fins

TIME AND LOCATION OF POUR:

- Date: _____ Time:_____
- Pour to begin on _____ side and commence on the _____ side
- Lighting plan if at night

PLAN AND SPECIFICATION REVIEW:

- The Contractor shall obtain a written statement from the manufacturer of the micro-silica admixture stating that he is satisfied with the compatibility of the combination of materials and the sequence in which they are combined.
- At the option of the laboratory, a trial batch may be made (4) four days prior to overlay
- Manufacturer representative shall be present during overlay
- No micro-silica overlays after October 15
- No rain to be forecasted during placement; if rain occurs, operations cease
- Air temperature must be below 85 degrees and not predicted to go over during concrete placement

    * Must be a minimum of 45 degrees during placement and curing period

- Surface evaporation rate must be equal to or less than 0.1 pound per square foot per hour as determined and documented by the contractor
- Wet deck prior to concrete placement but no ponding
- Mix characteristics shall be adjusted off the deck before placement of the overlay
- Maximum mix temperature is 90 degrees
- Vibrators shall be used in variable depth areas, edges and along enddams or bulkheads
- During short delays, overlay and grout shall be covered with wet burlap

    *Excess delays require bulkheads

- 3 day water cure: 1 layer of burlap with continuous water covered with plastic sheeting
- Contractor to stencil date of construction and the letters MS into the overlay
- Deck to be sounded after overlay to insure no delaminated areas

CA-S-5 Micro-Silica Overlay Pre-Pour Meeting - 2/3

PROJECT: _____ DATE: _____

CONCRETE PLANT:

- Presoak limestone 24 hours and allow to drain overnight *Don't charge bins with dry material
- Batching to begin at _____
- Expel all water from the mixers before loading / reloading
- Add super on jobsite if long haul distance
- Minimum of 70 revolutions on mixers before leaving plant unless central mixed
- Pour consists of approximately _____ CY
- Time between trucks _____ minutes
- Pour _____ cy./hr.
- Radio communication with plant for mix design changes
- Haul distance: _____ minutes

QUALITY CONTROL

- Modified micro-silica concrete
- W/C max = 0.36
- Slump 6 inches ± 2
- Air 8% ± 2
- Type A or D and F admixture shall be used
- Transit mixers are limited to carrying ¾ of its rated capacity or 6 cy whichever is less
- Any admixtures added at the jobsite shall be mixed a minimum of 5 minutes
- Discharge time = 90 minutes

CONTRACTOR'S OPERATION

- Tools
    * turf drag or broom finish, * straightedge, * finishing aid, * tining tool, * presoaked burlap
    * plastic for bad weather protection, * extra vibrator
- Concrete Placement
    * abrasive or water blast deck within 24 hours of overlay
    * air blast deck immediately before overlay
    * place plastic sheeting to avoid deck contamination
    * straightedge checking at bulkheads and enddams
    * need 2 walk-bridges (1 for finishers and 1 for burlap)

CA-S-5 Micro-Silica Overlay Pre-Pour Meeting - 3/3

PROJECT: _____ DATE: _____

PROJECT INSPECTION Personnel (If available)

- Moisture tests to be run at _____ followed by design of the mix.
- 1 Plant Inspector _____
    - * check moistures
    - * checking revolutions
    - * checking no wash water
- 2 Concrete Control Testers _____
    - * full test on every truck _____
    - * Cylinders as required every 50 CY
    - * check concrete temperature
- 1 Concrete Quality Control Inspector _____
    - * documenting any added materials
    - * check batch tickets
    - * time from start to discharge
    - * insuring 5 minute mixing time if materials added
    - * documenting test results
    - * fill out TE-45
- 1 Placement Inspector _____
    - * make depth checks
    - * Ensure curing is placed ASAP

MISCELLANEOUS

- Traffic Control

CA-S-5 Micro-Silica Overlay Pre-Pour Meeting - 3/3 (back)

CA-S-6 Class S Concrete Pre-Pour Meeting - 1/2

PROJECT: _____ **DATE:** _____

LOCATION: _____ **TIME:** _____

PRESENT: _____

_____

_____

DRY RUN: _____

- Check height of rail over enddams at all four corners - *Equal heights for left rear and fwd and for right rear and fwd
- Check any change in cross-slope and discuss method of performance
  - Confirm appropriate depth of roller fins
  - Check reinforcing steel clearances

TIME AND LOCATION OF POUR:

- Date: _____ Time:_____
- Pour to begin on _____ side and commence on the _____ side
- Location of pumps, if used
- Lighting plan if at night

PLAN AND SPECIFICATION REVIEW:

- Air temperature must be below 85^{o} and not predicted to go over during concrete placement
- Surface evaporation rate must be equal to or less than 0.2 lbs/sq. ft. per hour
- Must water cure: 2 layers of burlap with continuous water, or plastic coated/covered burlap with positive moisture seal.
  - Cure (5) five days with beam test

CONCRETE PLANT:

- Presoak limestone 24 hours and allow to drain overnight

  *Don't charge bins with dry material
- Batching to begin at _____
- Expel all water from the mixers before loading / reloading
- Add super on jobsite if long haul distance
- Minimum of 70 revolutions on mixers before leaving plant unless central mixed
- Pour consists of approximately _____ C.Y.
- Time between trucks _____ minutes
- Pour _____ cy./hr.
- Radio communication with plant for mix design changes
- Haul distance:_____ minutes

CA-S-6 Class S Concrete Pre-Pour Meeting - 2/2

PROJECT: _____ DATE: _____

QUALITY CONTROL (Air and Slump tests to be checked at the point of Placement)

- Class S Concrete
- W/C max = 0.44
- Air 6% ± 2
- Slump 2-4 inches (6" nom. And 7" max. with addition of type F or G admixture)
- Type B or D admixture (retarder) to be used if over 60^{o} F.
- Discharge time = 60 minutes (90 minutes with retarder)

CONTRACTOR'S OPERATION

- Tools
  - * broom finish, * straightedge, * wet burlap, * plastic for bad weather protection, * extra vibrator,
  - * weather gauges
- Concrete Placement
  - * air blast deck before pour
  - * wet forms before placement
  - * straightedge checking at bulkheads and enddams
  - * need 2 walk-bridges (1 for finishers and 1 for burlap)
  - * Groove as per 511.20
  - * smooth finish along curbs and/or parapets only
  - * wet burlap shall follow immediately after finishing

PROJECT INSPECTION Personnel (if available)

- Moisture tests to be run at _____
  followed by design of the mix.
- 1 Plant Inspector: _____
  - * writing tickets, * checking revolutions, * checking no wash water
- 2 Concrete Control Testers _____
  - * chase air on every truck, * various pump, if used, configuration correlation tests
  - * make beams, * check concrete temperature
- 1 Concrete Quality Control Inspector _____
  - * documenting any added materials, * checking rev's
  - * documenting test results, * fill out TE-45
- 1 Placement Inspector _____
  - * make depth checks, * make reinforcing steel depth checks
  - * insure curing is placed ASAP without marring surface

CA-S-7 QCS Inspection Documentation

Name (print clearly): _____
Project: _____ **Bridge (Co, Rt, Section):** _____
Area Inspected (ie span, beam lines etc.): _____

_____

Item(s) Inspected:

- □ QCP1, Removing asphalt cement, oil, grease, etc.
- □ QCP2, Grinding flange edges
- □ QCP3, Abrasive blasting
- □ QCP4, Containment/Waste disposal
- □ QCP5, Prime coat application
  - □ Surface cleaned prior to application of coating
  - □ Coating thickness
- □ QCP6, Removing fins, tears, & slivers
- □ QCP7, Washing of shop primer
- □ QCP8, Intermediate coat application:
  - □ Surface cleaned prior to application of coating
  - □ Coating thickness
- □ QCP9, Caulking
- □ QCP10, Finish coat application:
  - □ Surface cleaned prior to application of coating
  - □ Coating thickness
- □ QCP11, Final review:
  - □ All required patching performed
  - □ Surface cleaned
- □ Compressor checked - Time: _____
- □ New grit checked for oil

The above checked item(s) have been inspected by me and found to be in complete compliance with the requirements of the specifications.

Signature: _____ Date: _____

CA-S-7 QCS Inspection Documentation (back)

Area Inspected:	This should be very specific. If a defect occurs we need to be able to validate that the Quality Control Specialist (QCS) signed of for the work in this area. It may require that you measure from a fixed part of the structure (i.e. from the east abutment to 6 feet west of Pier #1).
QCP #5, #8, #10:	Each of these Quality Control Points (QCP) will need two separate sign offs. One prior to applying the coat of paint to ensure proper surface cleanliness and one after applying the coat of paint to ensure proper dry film thickness.
Compressor check:	This is only applicable when performing QCP #3 abrasive blasting or when performing QCPs #5, #8 and #10 if a conventional (non-airless) spray gun is used.
Grit check for oil:	This is only applicable when performing QCP #3 abrasive blasting

CA-S-20 Erection (Demolition) Procedure Checklist

Name (print clearly): _____

Project: _____ Bridge (Co, Rt, Section): _____

Description: _____

Items Inspected:

Plan:

□ Contractor's Erection (Demolition) Plan stamped by two PE's.

□ Contractor's Erection (Demolition) Plan accepted by regulatory agencies, Railroads, Coast Guard, U.S. Army Corps of Engineers, etc., if applicable.

Details:

□ Erection (Demolition) sequence for all members.

□ Maintenance of Traffic during erection (demolition) operations.

□ Location of permanent support structures, roads, railroads, waterways, utilities.

□ Member delivery location and orientation for erection.

□ Member removal location and orientation for demolition.

□ Location and radius of each crane during each pick.

□ Location of crane support (barges, mats, etc.) , during each pick.

□ Crane capacities shown for each crane configuration and boom length used.

□ Lifting weights of primary member picks, including all rigging.

□ Rigging weights, capacities, and arrangements for primary member picks.

□ Locations of the centers of gravity and lifting points for primary members.

□ Temporary supports or bracing.

□ Blocking for bridge bearings.

Calculations:

□ Load capacity and stability of crane(s), temporary supports and rigging for each pick and release.

□ Structural adequacy and stability of members for each erection (demolition) step.

Signature: _____ Date: _____

CA-S-20 Erection (Demolition) Procedure Checklist (back)

CA-S-21 Sealing of Concrete Surfaces Checklist

Name (print clearly): _____
Project: _____ Bridge (Co, Rt, Section): _____
Description: _____
Items Inspected:

Storage:

□ Thermometer to check for manufacturer's acceptable range

□ Sealer stored not frozen nor in sun

□ Shelf life

Submittals made:

□ Technical and application data

□ Material Safety Data Sheet

□ 100 Grit Sandpaper supplied by Contractor for comparison

Equipment for proper preparation:

□ Correct water blast equipment (7000 psi minimum)

□ Correct abrasive blast equipment (followed by cleaning)

Equipment mixing and application:

□ Equipment meets manufacturer's requirements:

Surface Preparation, clean concrete with 100 grit sandpaper texture:

□ Test site set up

□ Test all surfaces, (not just vertical)

□ Surface checked for texture

□ Acid Test performed if curing compound used

Mixing:

□ Material used within manufacturer's shelf life □ Mix time and pot life marked

□ Mixed per manufacturer's recommended procedures

Application:

□ Conditions acceptable

□ Material applied within pot life

□ Minimum coating rates met in test sections

- Epoxy – 120 Ft^2/gal, (150 Ft^2/gal if authorized)
- Urethane - 200 Ft^2/gal,(even coverage, no skips or sags)
- Non-Epoxy – 100 Ft^2/gal, Decks, 125 Ft^2/gal, Vert. Surfaces

MOISTURE CALCULATION				
	MATERIAL:			
A	TARE WT. = WT. OF PAN			
B	WET AGGREGATE + TARE WT			
C	WEIGHT OF WET AGG = B-A			
D	DRY AGGREGATE + TARE WT			
E	WEIGHT OF DRY AGG = D-A			
F	WEIGHT OF WATER = C-E			
G	(F ÷ E) x 100 = % MOISTURE			

GUIDELINES

(1) **Moisture = Free** >> Moisture probes determine and usually report the FREE moisture. Adjust calculations accordingly.

SSD Moist % = Absorption → found on OMM website (see MOP for instructions)

(2) **Moisture = Total** >> May be wet or air dry, A moisture test should be performed prior to batching to determine Total Moisture if probes are not used.

(3) The batching **Weight tolerance** for aggregates is ±2% from the Corrected Wt determined in the MIX DESIGN DATA section >> **Weight Tolerance** = $\frac{\text{FIELD SSD Wt} - \text{Corrected Wt}}{\text{Corrected Wt}} \times 100$

(4) **Unit Weight** (lbs/ft^3) = (Weight of the concrete in the air pot) x (pot factor) >> This is the weight of one cubic foot (1 ft^3) of concrete

(5) **Yield** (ft^3) = (Batch Weight) ÷ (Unit Weight); Divide the total batch weight by the batch size (yd^3) to get the batch weight for 1 cubic yard.
The Yield should be 27 ± 1% ft^3 (± 1% = ±0.27 ft^3)

CA-EW-8 Authorization of Undercuts

Project No. _____ Co-Rt-Sec _____ Date _____

Description _____

Instructions

1. All undercuts to be paid for shall be performed as directed by the Engineer and in accordance with the MOP.
2. Measurements may be made by cross-sections or average length, width and depth, whichever is more appropriate.
3. Furnish material removed, backfill, measurement type and location information.
4. Submit origional copy to District Construction Office immediately. Furnish copy to Contractor if requested.

Material Removed

- ☐ Suitable and used for fill
- ☐ Suitable and wasted
- ☐ Unsuitable

Backfill

- ☐ Material from right-of-way
- ☐ Earth from borrow
- ☐ Granular from borrow

Measurement Type

- ☐ Cross-sections per attached notes
- ☐ Measurements per drawing

Location

_____ Right or Left of centerline

_____ Elevation bottom of undercut

CA-FP-5 Roller Capacity and Placement Rate

Date _____

Project # _____ County, Route, Section _____

Contractor _____ Item # _____ Ref # _____

Description _____

Location _____ Bubble # _____ Plan Pg _____

1) Check rollers used; fill in the total weight and compare to requirements in 401.13-2 and -3. Contractor is to provide weights.
2) Calculate the total roller train capacity in (square yards per hour) and compare it the calculated placement rate.
3) Check compression rolls for steel wheel rollers and compare to requirements in 401.13-2.
4) This procedure must be used for asphalt concrete courses that do not have a density specification.

	Roller Type *(Check all that apply)*	Weight** (Lbs)	Roller Capacity (SY/HR)	# Rollers	# Drums	Width* (in.)	**Total** Roller Capacity (SY/HR)
	Tandem		700		→	→	0.0
	Three-Wheeled		700		→	→	0.0
	Trench		15 SY/HR per Inch Width*				0.0
	Pneumatic Tire, Type 1		1000		→	→	0.0

_____

_____

_____

_____

Inspector's Signature Date P.E./P.S. Signature Date

ODOT Form date: 7/1/2009

CA-FP-5 Roller Capacity and Placement Rate (back)

Example: Calculate maximum roller capacity and placement rate

A contractor is using one three-wheeled roller, one vibratory roller with 66 inch drums (both vibrating), and one Type 2 pneumatic tire roller to compact a mat that is 5 inches thick.

The material has a Lab Conversion Factor of 2.0 (tons/CY).

From 401.13-1 Roller Capacity Table

Three Wheel Roller (1)	700 SY/HR
Vibratory Roller (1)	2 drums x 66 inches/drum x 15 SY/HR per inch width = 1980 SY/HR
Type 2 Pneumatic Roller (1)	) SY/HR

Calculate Maximum Roller Capacity

700 SY/HR + 1980 SY/HR + 700 SY/HR = **3380 SY/HR**

Calculate Maximum Placement Rate

5 in. x (1 YD/36 in.) = 0.1389 YD

0.1389 YD x 3380 SY/HR = 469.48 CY/HR

469.48 CY/HR x 2 Ton/CY = **938.88 Ton/HR**

If the Contractor is placing 938.88 Ton/HR or less there will be adequate roller coverage.

Example: Check compression roll

A contractor is using a tandem roller with 53 inch width drums. The weight of the roller is 8 tons.

Calculate compression roll:

Compression Roll Lbs/in. = weight of roller (Lbs) / total width of all drums (in.)

= (8 tons x 2000 Lbs/ton) / (2 drums x 53 in.) = **150.9 Lbs/in.**

This compression roll does not meet the requirements of 401.12-2 (200 Lbs/in.)

CA-FP-6 Calculation of Liquid Asphalt Materials (back)

Notes:

This formula calculates volume at the specified pay temperature (109.01) for the asphalt material. If the actual temperature, as measured in the tank truck or distributor, differs from the specified pay temperature, the pay volume must be adjusted as per Supplement 1060.

Values for Temperature Factor, ""K"", and Coefficient of Expansion are included in ODOT Supplement 1060, Table A. Table B provides Pay Temperature and an index of formulas to be used for calculating volume based on actual measured temperature."

TE-217 Bituminous Concrete Density Determination - 446 Form Instructions

Day	Day Number (maybe greater than Lot number)
Date Placed	Date asphalt was placed
Beginning Station	Beginning station for the day
Ending Station	Ending station for the day
Width of Sublot	Paving lane width in feet
At Joint? Y or N	Enter Y for joint cores or N for non joint cores (see joint core tab)
Confined or Unconfined Joint?	Enter C for confined or U for unconfined (see joint core tab)
Generate Random Numbers	Use the random number table
Review and Print Form	Use the printed worksheet to layout the cores at paving site

Log into CMS to create a sample ID number and record it on the TE-217 form
Write in tonnage placed for the day in the Quantity box
Make any updates or comments to the form
Make a copy of the TE-217 for the project records
Send in the original TE-217 with cores

TE-217 Bituminous Concrete Density Determination - 446 Cores Instructions

Notes on 446 Density Acceptance and Joint Cores

Each production day = one lot = total tonnage
Each lot is divided into 5 sublots
Take 2 cores from each sublot for a total of 10 cores
Take 3 cold longitudinal joint cores*
Do not locate other mat cores closer than 12" to upper notch (or wedge joint) or vertical face of cold longitudinal join

*** For cold longitudinal joint cores - take 3 cores:**

Take one random core from Sublot 1
Take one random core from the one of the middle three Sublots, 2, 3, or 4
Take one random core from Sublot 5
Randomly determine if joint core is from confined or unconfined joint
See core location table and transverse location diagrams below.

LOCATIONS OF LONGITUDINAL JOINT CORES

Sublot 1		Sublot 2		Sublot 3		Sublot 4		Sublot 5	
Core 1	Core 2	Core 3	Core 4	Core 5	Core 6	Core 7	Core 8	Core 9	Core 10
1 Core Here		**1 Core Here**						**1 Core Here**

How to determine random numbers for purpose of determining core locations:

1. Randomly select a starting number from the table.
2. The following number can be the next number in that row or in that column. The choice is purely a matter of preference as long as the chosen method is consistently followed.
3. The number chosen shall be treated as a decimal (If random number = 5241; decimal is 0.5241)
4. For longitudinal core location; multiply the random number by length of sublot and add to the lot's beginning station.
5. For transverse core location; multiply the random number by the width of the sublot.

Example:
Length of sublot = 9000 feet; Width of Sublot = 12 feet; Beginning Station = 0+00; Longitudinal random number = 0.5241; Transverse random number = 0.4621

Calculate longitudinal core location:

0.5241 x 9000 feet = 4716.9 feet

Beginning station = 0+00 = 0 feet; Then core location = 0 + 4716.9 = 47+16.9

Calculate transverse core location:

0.4621 x 12 feet = 5.54 feet from right or left edge of pavement

TE-217 Bituminous Concrete Density Determination – (Blank)

CA-P-1 Pipe Construction Inspection Form - 1/2

Project # _____ County, Route & Section _____

Sample ID_____ Personnel ID _____ Date Sampled _____

Item # _____ Ref. # _____ Producer Code_____ Contractor _____

Description _____

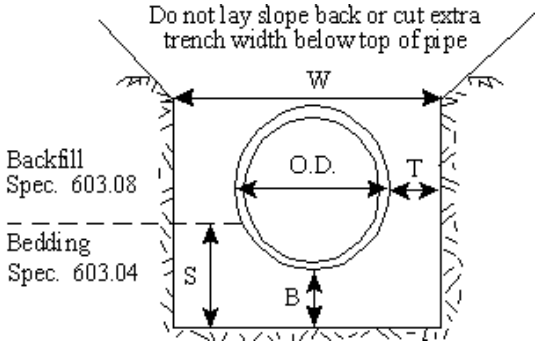
Location _____ Balloon Ref. # _____Plan Page _____ Pipe Material (RCP, Metal, HDPE, Other)

Type of Pipe *(circle one)* A B C D E F Pipe Markings _____

Provide a 2 to 1 slope from top of pipe in a cut to the top of excavation

Provide a 2 to 1 slope from spring-line of pipe in a fill to the top of excavation

W = Width of trench at Top of Pipe. Refer to Spec. 603.03



W = Width of trench at Top of Pipe. _____ Refer to Spec. 603.03

B = Thickness of bedding under pipe. _____

T = Outside diameter of pipe to trench wall. _____

S = Depth of bedding. _____

OD = Outside diameter of pipe. _____

* Type 2 is Shown See Specification For Type 1,3,4

For Type 2 Bedding Plastic: B= 6"(150 mm) S= B + 30% OD

For Type 2 Bedding Non Plastic: B= 3"(75 mm) S= B + 30% OD

TRENCH & BEDDING CHECKS (ACTUAL FIELD MEASUREMENTS)

Check Stations & Location	T	W	B	S	O.D.	Initial	Date

* Recommended checks every 50 feet, with a minimum of two checks per run. Check locations may be related to starting point such as outlet end, catch basin, C/L station, etc.

Field Measurements Lf. (meter)	Plan Pay Length Lf. (meter)	Grade Check Method	Backfill			Compaction Form#	Initials & Date
			Compaction Method Tamp, Flood, etc.	Type: Soil or Structural Backfill 1,2 or 3	Lift Depth		

Type of Joints (603.06) _____ Joints Installed Satisfactorily? ❑ Yes ❑ No

Materials: All tested and approved prior to incorporation into the project.

CA-P-1 Pipe Construction Inspection Form 2/2

Balloon Ref. # (s):_____ Plan Page (s):_____

Station to Station: _____

Plan Quantity: _____ LF (meters)

Remarks: _____

Daily Total Field Measured: _____ LF (meters) *

Remarks: _____

Daily Total Authorized Pay: _____ LF (meter)**:_____

* Explain field measurements and authorized pay. Pay in accordance with 603.12 Method of Measurement?
a) Structure or pipe end location moved or least cost to State when accommodating full sections.
b) Measured to C/L of structure when inside structure dimension is over 6 linear feet (2 meters) in direction of flow or only one structure on the run of pipe.
c) You must account to "Lab" for pipe length due to creep & measurements to C/L of structures.

** Round all Items Reference to nearest 0.1 foot (0.03 meter).

Remarks: Record problems, soft foundations, under cuts, rock, instructions, utilities encountered, etc. Describe and note location of existing conduits encountered, whether connected, plugged and abandoned, reconnected, etc.

CA-D-8 Long Term Work Zone Review - 2/2

DESCRIBE TRAFFIC ACCIDENTS (IF ANY):

DAMAGED OR MISSING MOT ITEMS:

LANE CLOSURES/ROLLING ROAD BLOCKS:

NO. OF LEO'S: TOTAL LEO HOURS

LEO ACTIVITIES

I certify that this document and all attachments submitted are, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information.

INSPECTED BY: (CONTRACTOR) DATE:

CA-D-9 Daily Concrete Pavement Documentation Form - 1 / 5

Project: _____ County/Route/Section: _____
Reference #: _____ Item #: _____
Contractor: _____
Station: _____ to _____ Lane: _____
Placement Width: _____ Placement Depth: _____
Date: _____
Temperature and Weather: _____
PCJMF: _____

SUBBASE

Subbase material and condition: _____

Was the subbase thoroughly moistened before placing concrete? _____ (451.06)

Method used to water subbase: _____

JOINTS (451.08)

Longitudinal Joints (451.08A) – Tie Bars

Length: _____ Size: _____ Depth placed: _____

Are tie bars epoxy coated? _____

Method of placing tie bars: _____

Are tie bars being kept horizontal in the slab? _____

Tie bar spacing? _____ Number of tie bars placed per typical panel? _____

Longitudinal joint located at _____ feet from left edge of slab

_____ feet from right edge of slab

CA- D-9 Daily Concrete Pavement Documentation Form - 2 / 5

Load Transfer Devices (451.08 B) - Transverse Joints

Dowel Length: _____ Diameter: _____ Depth placed: _____

Are dowel bars epoxy coated? _____

Were the dowel bars oiled? _____ Entire bar or alternating ends? _____

Are dowel bars being kept in the proper alignment? _____

Method of placing dowel bars? _____

Dowel bar spacing? _____ beginning _____ from edge of slab

Number of dowels placed per panel? _____ for _____ panel width

_____ for _____ panel width

Transverse joint spacing: _____

Expansion Joints (451.08C)

Dowel Length: _____ Diameter: _____ Depth placed: _____

Are dowel bars epoxy coated? _____

Were the dowel bars oiled? _____

Were expansion sleeves installed? _____

On opposite ends of adjacent dowels? _____

Transverse joint spacing: _____

Construction Joints (451.08E)

Construction joint type: _____

Method of doweling construction joint: _____

Location of construction joint with respect to contraction joint: _____

CA- D-9 Daily Concrete Pavement Documentation Form - 3 / 5

PLACING CONCRETE (451.06)

Method of Construction – Fixed Form or Slip Formed? _____

Formed Construction

Forms made of steel? _____

Form depth equal to pavement thickness? _____

Forms cleaned and oiled? _____

Slip Form Construction

Slip form paver make/ model: _____

Number of internal vibrators: _____

Vibrator monitors working? _____

Were all vibrators working properly? _____

Vibration frequency range _____ to _____ ipm

Was vibrator information recorded? _____

Method of aligning paver: _____

Paver advancement rate: _____ feet/minute

Is the longitudinal face of the slab being kept vertical? _____

Any projections or ridges exceeding tolerances in 451.03B? _____

Method of depositing concrete:

Is a spreader required/used? _____

Was its use waived? / Reason: _____

CA- D-9 Daily Concrete Pavement Documentation Form - 4 / 5

FINISHING (451.09)

Hand finishing methods used: _____

Was 10’ straightedge used? _____

Were pavement edges rounded? _____

Micro texture type: _____ applied using: _____

Macro texture type: _____ applied using: _____

Tine groove spacing: _____ Tine depth: _____

Were station numbers stamped into the shoulder pavement? _____ Spacing? _____

Station number position: _____

CURING (451.10)

Method of applying curing compound: _____

Curing compound required: Width = _____ (slab width) + 2 x _____ (slab thickness) = _____

Gallons Required = _____ (length) x _____ (width) / 150 = _____

Gallons Used = _____ (begin tank) - _____ (end tank) = _____

Curing compound applied approximately _____ minutes after final finishing

JOINT SAWING (451.08)

Was a HIPERPAV file submitted for this pour? _____

HIPERPAV predicts early age cracking beginning at _____ without joint sawing.

Joint sawing began at _____

Method of sawing: Early-entry saw? _____ Wet Sawing? _____

	Width of Saw Cut	*Depth of Saw Cut*
Longitudinal Joints:	_____	_____
Contraction Joints:	_____	_____

(yellow)	Manual Entry into DLS by operator
(green)	Electronic Entry from DLS
(pink)	Calculated by spreadsheet

Notes:
- Program DLS to record data for each section to be painted, **by direction**, even if section length is less than 10 miles.
- Do not start a new section at 10 miles even if section length exceeds 10 miles.
- Whenever material or beads are loaded, end the section, record data for the completed section, reload striper, then begin new section.
- Application rates and average thickness and MPH are calculated over the length of the section painted from Start Hwy SLM to End Hwy SLM.
- Copy of DLS Report is to be provided to Engineer not later than one day following the application of material to a section of highway.

Mix Plant Code (1): _____ at _____

Material Code: _____

Brand Name: _____

Description 1: _____ 2: _____ 3: _____

Represents Quantity (2): _____ Unit of Measure:_____

Number of Items: _____ Consigned to: _____

Sampled from: _____ Mfg. Control Number: _____

Responsible Location: _____ Test Lab: _____

Assign To	Project PO	PO Ind	Item Code	Ref No	Quantity

Lot/Day (3): _____ JMF (3): _____

Concrete Cylinder Specimen Numbers (4): _____ Bill of Lading No: _____

Remarks: _____

_____

_____

_____

_____

(1) Same materials are used at a Bituminous or PC Concrete mix plant and are sampled and tested by plant and not by project. For these samples the producer/supplier is identified in the P/S field and the mix plant where the material is sampled is identified in the mix plant field.

(2) Job control samples require a quantity.

(3) Rice and Extraction Samples require a JMF, 411 materials require Lot/Day No.

(4) Identifies concrete cylinders being shipped to the Test lab (TE-31 not to be entered into CIVIS - data already entered from corresponding TE-45)

TE-31 Sample Data (back)

Noise Barrier Wall Shop Drawing Review Checklist

The purpose of this checklist is to assist the Engineer with the Department's review of shop drawings submitted by the Contractor in accordance with Standard Bridge Drawing, NBS-1-09.

- ☐ The shop drawings are signed, sealed and dated by an Ohio Registered Professional Engineer. See footnote ( ).
- ☐ The Contractor has accepted the shop drawings in writing. See footnote (1).
- ☐ The acceptance letter documents all issues raised by the contractor, fabricator and Department including disposition of issues. See footnote (1).
- ☐ For absorptive walls, the absorptive wall material supplier is a pre-approved supplier in accordance with NBS-1-09 or all certified test data and performance history documentation has been provided and is in accordance with NBS-1-09. See footnote (1).
- ☐ The shop drawing top of wall elevation at each panel meets or is above the plan requirements. See footnote ( ).
- ☐ The shop drawing bottom of wall elevation at each panel meets or is lower than the plan requirements. See footnote (2).
- ☐ The total panel height at each location meets the plan requirements and is consistent with the top and bottom of wall elevations as provided in the shop drawings. See footnote (2).
- ☐ The shop drawing post height at each location meets the plan requirements. See footnote (2).
- ☐ The shop drawing individual panel designs are in accordance with NBS-1-09. See footnote (3).
- ☐ The shop drawing individual post designs are in accordance with NBS-1-09. See footnote (3).
- ☐ The shop drawing wall alignment is in accordance with the contract requirements. See footnote (3).
- ☐ The shop drawing material requirements are in accordance with NBS-1-09. See footnote (3).
- ☐ The shop drawing aesthetic treatments are in accordance with the contract requirements, including alignment of horizontal joint lines for at least 96-ft. See footnote ( ).
- ☐ The shop drawing base plate and anchor bolt requirements are in accordance with NBS-1-09. See footnote (3).

If all checklist items are met, mark documents as "ACCEPTED".

Footnotes:

1. If missing, mark documents as "NOT ACCEPTED".
2. Document all discrepancies and mark documents "ACCEPTED AS NOTED". Resubmittal is not required.
3. **Document all discrepancies and mark documents "ACCEPTED AS NOTED – RESUBMIT".**
