Construction Documentation Forms

Introduction

The Ohio Department of Transportation is devoted to maintaining high levels of project inspection and documentation across the State. The forms and instructions contained herein are provided to project personnel to assist in the proper determination of compliance with the provisions of the contract, the measurement of quantities for payment, and the documentation of compliance and measurements.

In no instance does this document alter the provisions of the contract.

These procedures will be used to provide a uniform and fair basis of operations wherever the Ohio Department of Transportation provides supervision or engineering services for the acquisition, construction, or maintenance of materials or services. This is not a contract document, and is not to be construed in any way to obligate the Ohio Department of Transportation to perform any duties. These forms should be used in conjunction with the Construction Administration Manual of Procedures.

Reference Documents

Documents normally used for detailed interpretation of substantiation requirements, practices, and test methods are:

1. Ohio Manual of Uniform Traffic Control Devices
2. Sampling and Testing Manual, Testing Administration Manual
3. Traffic Engineering Manual
4. Construction Administration Manual of Procedures

Other documents may also be used as they are developed and published.

More testing forms (those beginning with TE) can be found online here:

http://www.dot.state.oh.us/Divisions/ConstructionMgt/Materials/Pages/TE_Forms.aspx

Districts are permitted to customize forms as long as ***all*** of the data listed on the standard forms published here is also included on the modified forms.

Many of these forms are available in Excel format with automated calculation fields. They can be found online here:

http://www.dot.state.oh.us/Divisions/ConstructionMgt/Admin/Pages/InspectionForms.aspx

Forms called for in the Contract Administration area such as DBE Certification, Payroll, EDGE, and EEO may be found online here:

http://www.dot.state.oh.us/Divisions/ContractAdmin/Contracts/Pages/DBE.aspx

Instruction Codes

The following instructions, grouped by measurement type, supplement the general instructions and have particular application to specific pay items. Match the Instruction Code listed in the Index of Pay Items tables (starting on page 4) to the following Instruction Codes to determine specific documentation requirements. Special and unlisted pay items will be documented using the guidelines outlined in the Construction Administration Manual of Procedures (MOP).

Instruction Code	Description
	Conversion Type Measurements
C-1	Summarize the final weight to nearest ton (metric ton) from validated weight tickets and determine the final volume to the nearest cubic yard (cubic meter) by using conversion factor.
C-2	Summarize and convert to nearest ton (metric ton) for the final quantity by conversion from validated tickets. Convert sack and brine shipments to weight as specified.
C-3	Summarize the final quantity to nearest cubic yard (cubic meter) by conversion from validated weight tickets. Include a daily coordination of weight tickets with placement and location. Where there is a moisture limitation, at least one moisture test must be made (more if necessary) to provide for an appropriate deduction.
C-4	Determine volume to nearest gallon (liter) by conversion from validated weight tickets. Where source validation is missing, or for partial loads, determine volume by conversion from weigh-back or by measurement of tank. Where basic measurement is by volume, record temperature.
C-5	Determine the final quantity to nearest cubic yard (cubic meter) from plan quantity adjusted for errors and changes. Use for new construction on new subgrade. For variable thickness or resurfacing determine quantity to nearest cubic yard (cubic meter) by conversion from validated weight tickets.
C-6	For direct volume measurements determine volume to nearest cubic yard (cubic meter) from cross-sections before and after removal. For converted volume measurements, summarize validated weight tickets and convert to nearest cubic yard (cubic meter) using density tests as basis for conversion. Adjust measured quantity by deducting embankment in excess of allowable tolerances, if any, in accordance with the Earthwork section of the MOP.
C-7	Determine the area by field measurement to nearest square yard (square meter). Substantiate rates of application by means of at least one test area made at time of application. Determine rate of application on test area by calculation from verified quantities of material placed and measured in the area over which it is applied. For seeding and mulching, record number of square yards (square meters) having substantiated rates of application.
	Volume Type Measurements
V-1	Determine volume to nearest cubic yard (cubic meter) using recorded verified plan dimensions, which include a verification of depth and thickness.
V-2	Record verified plan dimensions of the forms and calculate the volume of each unit. Summarize the final quantity to the nearest cubic yard (cubic meter) or decimal as indicated by the estimated bid quantity (Ref. No.).
V-3	Determine the volume before removal or determine the volume from verified plan dimensions to the nearest cubic yard (cubic meter).
V-4	Plan quantity must be paid as per specification 203.09. Any plan changes must be documented using cross-sections per C-6 or measurements per V-1.
V-5	Determine the volume loose in a vehicle at the point of delivery and summarize to the nearest cubic yard (cubic meter).
V-6	Determine the volume to the nearest cubic yard (cubic meter) using specified dimensions and vertical measurements between bottom plane of footing and top of rock or shale excavation.
V-7	Determine the volume to the nearest cubic yard (cubic meter) from summarization of validated delivery tickets. Tickets must record cubic yard (cubic meter) from predetermined tank size or sizes, converted weight, or meter readings. Tickets for each load must be issued by the contractor and must be collected, identified, and validated by the inspector at the point of delivery.
V-8	Determine the volume to the nearest cubic yard (cubic meter) by using horizontal dimensions established by 503.10 of the specifications.
	Weight Type Measurements
W-1	Summarize the weight to the nearest 100 pounds (50 kilograms) by using validated scale weight tickets or weights calculated from the verified dimensions and steel handbook.
W-2	Obtain a copy of a memorandum from the Office of Structural Engineering for approved pay weights.
W-3	Summarize the validated delivery tickets to the nearest ton (metric ton). Determine the volume of the embankment, if any, in excess of the allowable tolerances, convert to tons (metric tons), and deduct from the summarized weight.
W-4	Summarize to the nearest ton (metric ton) from the validated weight tickets.
W-5	Summarize to the nearest pound (kilogram) from the validated weight tickets.
	Linear Type Measurements
L-1	Measure the length of the item and summarize to the nearest foot (meter).
L-2	Measure the length of an item to the nearest foot (meter), include data as to its re-use and storage.
L-3	Measure the length of the item to the nearest 1/100th mile (1/100 kilometer, e.g. 19.98 kilometer), etc.
L-4	Measure the length to the nearest 0.1 ft (0.1 meter, e.g. 14.8 meter), etc.
L-5	Guardrail quantities are normally determined in standard 12 feet 6 inch (3.81 meter) panel lengths with adjustments for end assemblies, in multiples of 6.25 feet (1.905 meter).
L-6	Measure the length of an item to the nearest 1/100th mile (1/100 kilometer, e.g. 19.98 kilometer), etc. and include deficiency data as per the specifications.
L-7	Measure the length of piles between extreme point and cut-off to the nearest 0.1 ft (25 millimeters). Measure the inside of cast-in-place piles and make a conformance statement relative to the measurement and length marks. Summarize the measurements to the nearest foot (meter). Locate the piles by use of the numbering system on the piling layout.
L-8	For items 603 and 605 measure the length of the item and round up to the next foot (0.5 meter).
	Area Type Measurements
A-1	Measure the surface dimensions of the item, calculate the area, and summarize to the nearest square yard (square meter).

A-2	Adjust the plan area for changes, errors, and deviations in excess of the allowable tolerances, and summarize to the nearest square yard (square meter).
A-3	Determine the specified plan areas of each size and type from verified shop drawings and summarize to the nearest 1/10 square yard (1/10 square meter).
A-4	Plan quantity as per specification 659.24. Check application rates and deduct area if the application rates are below specifications for seed, mulch, and emulsion.
	Unit (each) Type Measurements
U-1	Determine the number of units.
U-2	Determine the number of units visible on completion and make a statement relative to the conformance with the contract requirements.
U-3	Determine the number of units and include the data as to reuse or storage or disposal by Contractor.
	Lump Sum Type Measurements
LS-1	Verify that the work is in accordance with the plans.
LS-2	Record driving log of first test pile or the results of the test loads and locate by use of the numbering system on the piling layout.
	Miscellaneous Type Measurements
M-1	Summarize the final rolling time to the nearest hour. Include the data on weight and tire pressure.

Index of Pay Items for the Construction Inspection Forms

Earthwork (200)

ITEM	DESCRIPTION	UNITS Required Accuracy Daily Entries	CODE	FORM	TKTS
201	**Clearing and Grubbing**				
201	trees or stumps removed, _____ size	each	U-1	CA-D-1A/1B or CA-D-3SM	
201	clearing and grubbing	lump	LS-1	CA-D-3SM	
202	**Removal of Structures and Obstructions**				
202	structures removed	lump	LS-1	CA-D-3SM	
202	portions of structures removed	lump	LS-1	CA-D-3SM	
	portions of structures removed	1 yd^3	V-3	CA-D-1A/1B	X
	portions of structures removed	100 pound	W-1	CA-D-1A/1B weight	
202	pipe removed for reuse or storage	1 foot	L-2	CA-D-1A/1B or CA-D-3SM	
202	pipe removed	1 foot	L-1	CA-D-1A/1B or CA-D-3SM	
202	pavement removed	0.1 yd^2	A-1	CA-D-1A/1B	
202	wearing course removed	0.1 yd^2	A-1	CA-D-1A/1B	
202	base removed	0.1 yd^2	A-1	CA-D-1A/1B	
202	walk removed	0.1 yd^2	A-1	CA-D-1A/1B	
202	steps removed	lump	LS-1	CA-D-3SM	
202	curb removed	1 foot	L-1	CA-D-1A/1B or CA-D-3SM	
202	curb and gutter removed	1 foot	L-1	CA-D-1A/1B or CA-D-3SM	
202	gutter removed	1 foot	L-1	CA-D-1A/1B or CA-D-3SM	
	gutter removed	0.1 yd^2	A-1	CA-D-1A/1B	
202	curb removed for storage	1 foot	L-2	CA-D-1A/1B or CA-D-3SM	
202	precast traffic dividers removed for re-use and storage	each	U-3	CA-D-1A/1B or CA-D-3SM	
202	buildings demolished	lump	LS-1	CA-D-3SM	
202	underground storage tank removed	each	U-1	CA-D-3SM	
202	regulated storage tank removed	each	U-1	CA-D-3SM	
202	septic tank removed	each	U-1	CA-D-3SM	
202	privy vault removed	each	U-1	CA-D-3SM	
202	guardrail removed	1 foot	L-1	CA-D-2 or CA-D-3SM	
202	guardrail removed for re-use or storage	1 foot	L-2	CA-D-2 or CA-D-3SM	
202	fence removed for re-use or storage	1 foot	L-2	CA-D-2 or CA-D-3SM	
202	rpm's removed for disposal by contractor	each	U-3	CA-D-2 or CA-D-3SM	
202	manhole removed	each	U-1	CA-D-3SM	
202	manhole abandoned	each	U-1	CA-D-3SM	
202	catch basin of inlet removed	each	U-1	CA-D-3SM	
202	catch basin or inlet abandoned	each	U-1	CA-D-3SM

CA-S-2 Paint Thickness (QCP #5, #8, #10) (back)

Top Section:	This section is used for general information.
Middle Section:	This section is to help you determine how many 100 square foot areas must be tested. See CM&S 514.20
Bottom Section:	This section is used to calculate and record the dry film thickness (DFT) readings on a member in a particular area. The spot averages should be compared to the minimum and maximum spot thinknesses given in the table in CM&S 514.20. The Area Averages should be compared to the minimum and maximum specified thicknesses given in the table in CM&S 514.20

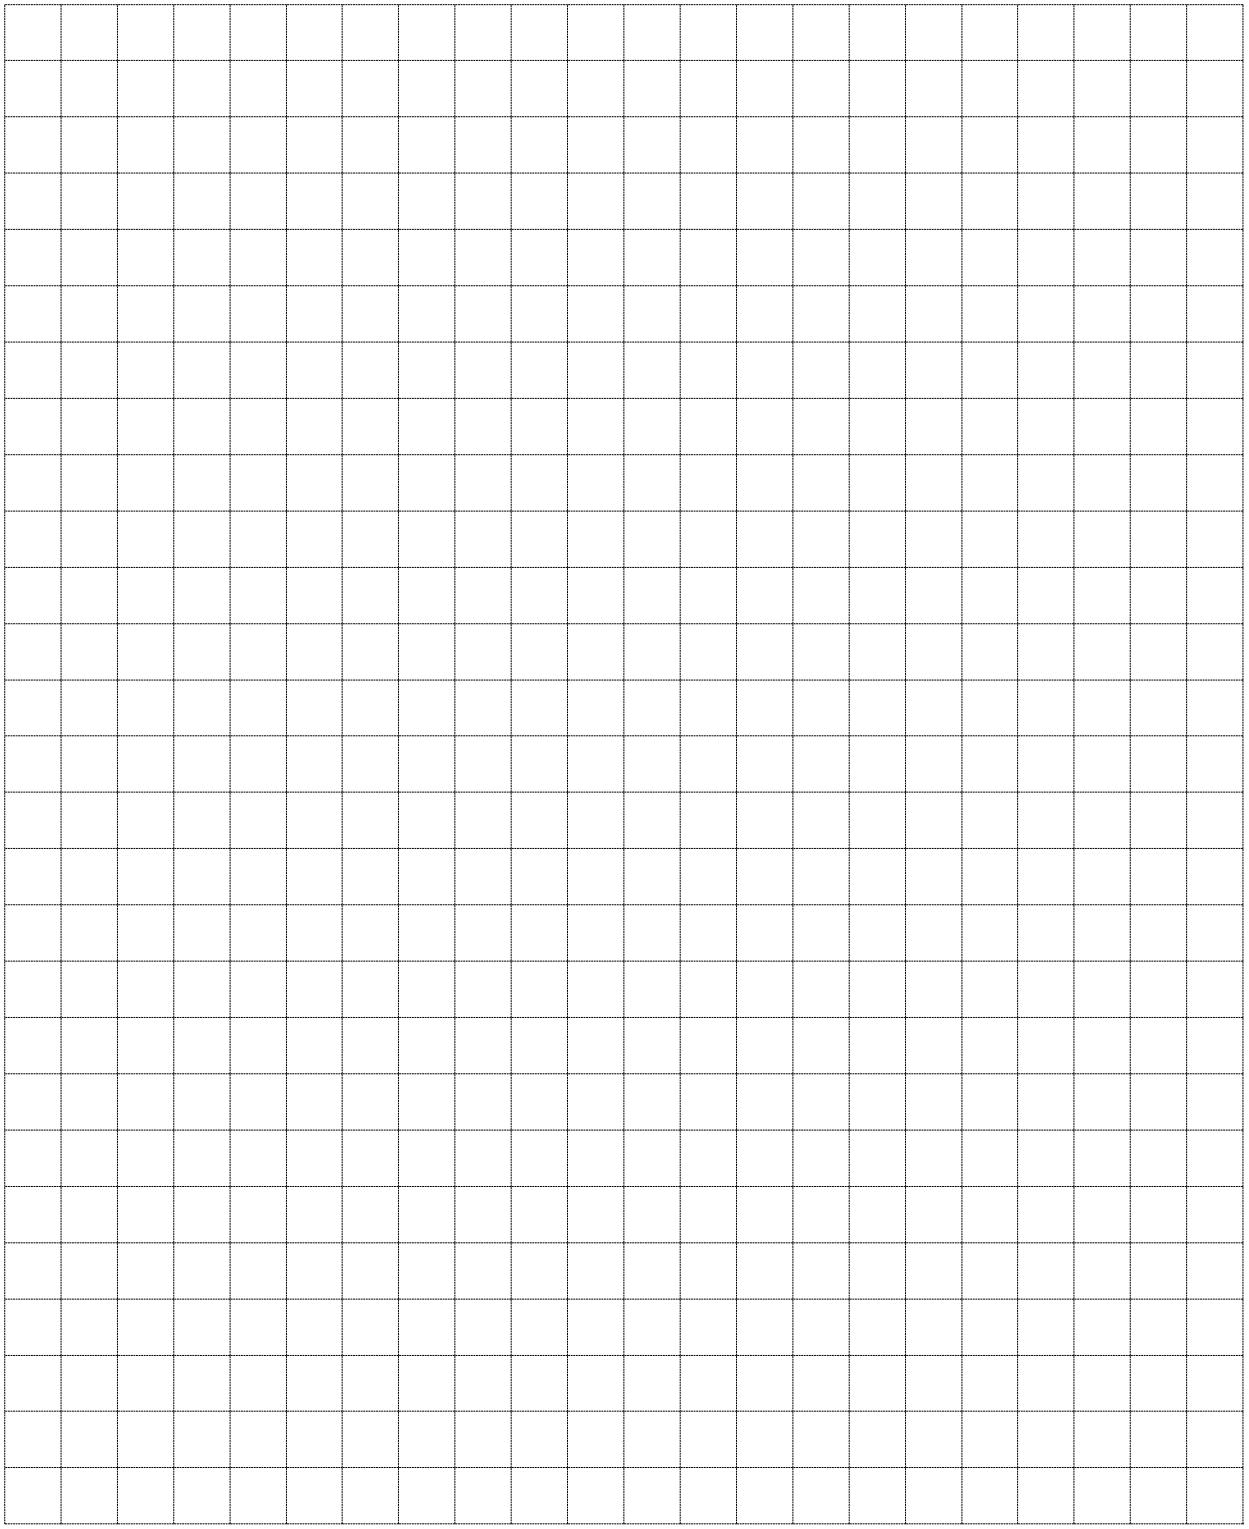
Project Personnel _____

Date _____

CA-S-3A (BR-2-75A) Pile Driving Log Summary (back)



CA-S-4 High Performance Concrete Pre-Pour Meeting - 1/3

PROJECT: _____ DATE: _____

LOCATION: _____ TIME: _____

PRESENT: _____

_____

_____

DRY RUN:

– Check height of rail over enddams at all four corners - *Equal heights for left rear and fwd and for right rear and fwd

– Check any change in cross-slope and discuss method of performance

- Confirm appropriate depth of roller fins
- Check reinforcing steel clearances

TIME AND LOCATION OF POUR:

– Date: _____ Time:_____

– Pour to begin on _____ side and commence on the _____ side

– Location of pumps, if used

– Lighting plan if at night

PLAN AND SPECIFICATION REVIEW:

– Need a written statement, from the admixture supplier verifying the compatibility of materials, a mix design, and a batching sequence

– Need successful test pour prior to concrete placement

– A technical representative is required during concrete placement

– Calendar restrictions for flyash are waived

– Need verification of vibration frequencies on finishing machine

– No rain to be forecasted during placement; if rain occurs, operations cease

– Surface evaporation rate must be equal to or less than 0.1 pound per square foot per hour DURING the pour as determined and documented by the contractor

– Vibrators shall be used

– Mix characteristics shall be adjusted off the deck before placement

– Maximum mix temperature is 90 degrees

– 7 day water cure: 1 layer of burlap with continuous water covered with plastic sheeting, apply membrane cure as per 511.19 method (b) within 12 hours of burlap removal

– Prior to opening to traffic, check top and bottom for cracks and, if necessary, reseal from the top

– Can open to traffic after membrane cure is applied, unless between October 15 and March 30, then must wait 30 days

– Seal joints with HMWM

– Re-apply membrane cure after grooving, unless concrete is older than 30 days

CA-S-4 High Performance Concrete Pre-Pour Meeting - 2/3

PROJECT: _____ DATE: _____

CONCRETE PLANT:

– Presoak limestone 24 hours and allow to drain overnight - *Don't charge bins with dry material

– Batching to begin at _____

– Expel all water from the mixers before loading / reloading (especially important for micro-silica mixes)

– Dissolvable micro-silica bags are not allowed

– A slow ribbon feed of cement is required

– Mix 5 minutes at plant

– Pour consists of approximately _____ C.Y.

– Time between trucks _____ minutes

– Pour _____ cy./hr.

– Radio communication with plant for mix design changes

– Haul distance: _____ minutes

QUALITY CONTROL

– High Performance Concrete

– Mix no. _____

– Proportioning and batching changes are contractor's responsibility

– W/C max = 0.40, (mix 3 and 4), based on total cementitious material

– Maximum slump = 8 inches

– Air 7% ± 2

– Flyash, unless use slag, shall be type C

– Type F or G admixture is required for workability; suggest using type A for finishing advantages

– Any admixtures added at the jobsite shall be mixed a minimum of 5 minutes

– Air and slump tests are to be taken at point of placement

– Discharge time = 90 minutes

  – No "balling" of mix, if balling occurs load will be rejected and mixing process revised

CONTRACTOR'S OPERATION

– Tools

  * broom finish
  * vibrating pan or rollers
  * straightedge
  * presoaked burlap
  * plastic for bad weather protection
  * extra vibrator

CA-S-4 High Performance Concrete Pre-Pour Meeting - 3/3

PROJECT: _____ DATE: _____

CONTRACTOR'S OPERATION (Continued)

– Concrete Placement

* wet deck continuously in front of placement
* place plastic sheeting to avoid deck contamination
* straightedge checking at bulkheads and enddams
* need 2 walk-bridges (1 for finishers and 1 for burlap)
* smooth finish along curbs and/or parapets only
* burlap shall follow as close as possible to deck overlay

PROJECT INSPECTION Personnel (If available)

– Moisture tests to be run at _____

– 1 Plant Inspector

* Checking aggregate moistures
* checking revolutions
* checking no wash water, no wash down water after batching

– 2 Concrete Quality Control Testers _____

* chase air on every truck _____
* Air, slump, yield
* Cylinders made every 200 CY.
* various pump, if used, configuration correlation tests
* make beams
* check concrete temperature

– 1 Concrete Quality Control Inspector _____

* documenting any added materials
* check batch tickets
* time from start to discharge
* insuring 5 minute mixing time if materials added
* documenting test results
* fill out TE-45

– 1 Placement Inspector _____

* make depth checks
* make reinforcing steel depth checks
* insure curing is placed ASAP

MISCELLANEOUS

– Traffic Control

CA-S-4 High Performance Concrete Pre-Pour Meeting - 3/3 (back)

CA-S-5 Micro-Silica Overlay Pre-Pour Meeting - 1/3

PROJECT: _____ **DATE:** _____

LOCATION: _____ **TIME:** _____

PRESENT: _____

_____

_____

DRY RUN:

– Check height of rail over enddams at all four corners - *Equal heights for left rear and fwd and for right rear and fwd

– Check any change in cross-slope and discuss method of performance

– Confirm appropriate depth of roller fins

TIME AND LOCATION OF POUR:

– Date: _____ Time:_____

– Pour to begin on _____ side and commence on the _____ side

– Lighting plan if at night

PLAN AND SPECIFICATION REVIEW:

– The Contractor shall obtain a written statement from the manufacturer of the micro-silica admixture stating that he is satisfied with the compatibility of the combination of materials and the sequence in which they are combined.

– At the option of the laboratory, a trial batch may be made (4) four days prior to overlay

– Manufacturer representative shall be present during overlay

– No micro-silica overlays after October 15

– No rain to be forecasted during placement; if rain occurs, operations cease

– Air temperature must be below 85 degrees and not predicted to go over during concrete placement

* Must be a minimum of 45 degrees during placement and curing period

– Surface evaporation rate must be equal to or less than 0.1 pound per square foot per hour as determined and documented by the contractor

– Wet deck prior to concrete placement but no ponding

– Mix characteristics shall be adjusted off the deck before placement of the overlay

– Maximum mix temperature is 90 degrees

– Vibrators shall be used in variable depth areas, edges and along enddams or bulkheads

– During short delays, overlay and grout shall be covered with wet burlap

*Excess delays require bulkheads

– 3 day water cure: 1 layer of burlap with continuous water covered with plastic sheeting

– Contractor to stencil date of construction and the letters MS into the overlay

– Deck to be sounded after overlay to insure no delaminated areas

CA-S-5 Micro-Silica Overlay Pre-Pour Meeting - 2/3

PROJECT: _____ DATE: _____

CONCRETE PLANT:

– Presoak limestone 24 hours and allow to drain overnight *Don't charge bins with dry material

– Batching to begin at _____

– Expel all water from the mixers before loading / reloading

– Add super on jobsite if long haul distance

– Minimum of 70 revolutions on mixers before leaving plant unless central mixed

– Pour consists of approximately _____ CY

– Time between trucks _____ minutes

– Pour _____ cy./hr.

– Radio communication with plant for mix design changes

– Haul distance: _____ minutes

QUALITY CONTROL

– Modified micro-silica concrete

– W/C max = 0.36

– Slump 6 inches ± 2

– Air 8% ± 2

– Type A or D and F admixture shall be used

– Transit mixers are limited to carrying ¾ of its rated capacity or 6 cy whichever is less

– Any admixtures added at the jobsite shall be mixed a minimum of 5 minutes

– Discharge time = 90 minutes

CONTRACTOR'S OPERATION

– Tools

* broom finish, * vibrating pan or roller, * straightedge, * presoaked burlap
* plastic for bad weather protection, * extra vibrator

– Concrete Placement

* abrasive or water blast deck within 24 hours of overlay
* air blast deck immediately before overlay
* place plastic sheeting to avoid deck contamination
* straightedge checking at bulkheads and enddams
* need 2 walk-bridges (1 for finishers and 1 for burlap)

CA-S-5 Micro-Silica Overlay Pre-Pour Meeting - 3/3

PROJECT: _____ DATE: _____

PROJECT INSPECTION Personnel (If available)

– Moisture tests to be run at _____ followed by design of the mix.

– 1 Plant Inspector _____

* check moistures
* checking revolutions
* checking no wash water

– 2 Concrete Control Testers _____

* full test on every truck _____
* Cylinders as required every 50 CY
* check concrete temperature

– 1 Concrete Quality Control Inspector _____

* documenting any added materials
* check batch tickets
* time from start to discharge
* insuring 5 minute mixing time if materials added
* documenting test results
* fill out TE-45

– 1 Placement Inspector _____

* make depth checks
* Ensure curing is placed ASAP

MISCELLANEOUS

– Traffic Control

CA-S-5 Micro-Silica Overlay Pre-Pour Meeting - 3/3 (back)

CA-S-6 Superstructure Concrete Pre-Pour Meeting - 1/2

PROJECT: _____ **DATE:** _____

LOCATION: _____ **TIME:** _____

PRESENT: _____

_____

_____

DRY RUN: _____

– Check height of rail over enddams at all four corners - *Equal heights for left rear and fwd and for right rear and fwd

– Check any change in cross-slope and discuss method of performance

- Confirm appropriate depth of roller fins
- Check reinforcing steel clearances

TIME AND LOCATION OF POUR:

– Date: _____ Time:_____

– Pour to begin on _____ side and commence on the _____ side

– Location of pumps, if used

– Lighting plan if at night

PLAN AND SPECIFICATION REVIEW:

– Air temperature must be below 85^{o} and not predicted to go over during concrete placement

– Surface evaporation rate must be equal to or less than 0.2 lbs/sq. ft. per hour

– Must water cure: 2 layers of burlap with continuous water, or plastic coated/covered burlap with positive moisture seal.

– Cure (5) five days with beam test

CONCRETE PLANT:

– Presoak limestone 24 hours and allow to drain overnight

*Don't charge bins with dry material

– Batching to begin at _____

– Expel all water from the mixers before loading / reloading

– Add super on jobsite if long haul distance

– Minimum of 70 revolutions on mixers before leaving plant unless central mixed

– Pour consists of approximately _____ C.Y.

– Time between trucks _____ minutes

– Pour _____ cy./hr.

– Radio communication with plant for mix design changes

CA-S-6 Superstructure Concrete Pre-Pour Meeting - 2/2

ROJECT: _____ DATE: _____

QUALITY CONTROL (Air and Slump tests to be checked at the point of Placement)

– Class QC2 or QC 3 Concrete – Slump 2-4 inches (6" nom. And 7" max. with addition of type F or G admixture) – W/C max = 0.44 – Type B or D admixture (retarder) to be used if over 60^{o} F.

– Air 6% ± 2

– Discharge time = 60 minutes (90 minutes with retarder)

CONTRACTOR'S OPERATION

– Tools

* broom finish, * straightedge, * wet burlap, * plastic for bad weather protection, * extra vibrator,
* weather gauges

– Concrete Placement

* air blast deck before pour
* wet forms before placement
* straightedge checking at bulkheads and enddams
* need 2 walk-bridges (1 for finishers and 1 for burlap)
* Groove as per 511.20
* smooth finish along curbs and/or parapets only
* wet burlap shall follow immediately after finishing

PROJECT INSPECTION Personnel (if available)

– Moisture tests to be run at _____

followed by design of the mix.

– 1 Plant Inspector: _____

* writing tickets, * checking revolutions, * checking no wash water

– 2 Concrete Control Testers _____

* chase air on every truck, * various pump, if used, configuration correlation tests
* make beams, * check concrete temperature

– 1 Concrete Quality Control Inspector _____

* documenting any added materials, * checking rev's
* documenting test results, * fill out TE-45

– 1 Placement Inspector _____

* make depth checks, * make reinforcing steel depth checks
* insure curing is placed ASAP without marring surface

CA-S-7 QCS Inspection Documentation

Name (print clearly): _____
Project: _____ **Bridge (Co, Rt, Section):** _____
Area Inspected (ie span, beam lines etc.): _____

_____

Item(s) Inspected:

- □ QCP1, Removing asphalt cement, oil, grease, etc.
- □ QCP2, Grinding flange edges
- □ QCP3, Abrasive blasting
- □ QCP4, Containment/Waste disposal
- □ QCP5, Prime coat application
  - □ Surface cleaned prior to application of coating
  - □ Coating thickness
- □ QCP6, Removing fins, tears, & slivers
- □ QCP7, Washing of shop primer
- □ QCP8, Intermediate coat application:
  - □ Surface cleaned prior to application of coating
  - □ Coating thickness
- □ QCP9, Caulking
- □ QCP10, Finish coat application:
  - □ Surface cleaned prior to application of coating
  - □ Coating thickness
- □ QCP11, Final review:
  - □ All required patching performed
  - □ Surface cleaned
- □ Compressor checked - Time: _____
- □ New grit checked for oil

The above checked item(s) have been inspected by me and found to be in complete compliance with the requirements of the specifications.

Signature: _____ Date: _____

CA-S-7 QCS Inspection Documentation (back)

Area Inspected:	This should be very specific. If a defect occurs we need to be able to validate that the Quality Control Specialist (QCS) signed of for the work in this area. It may require that you measure from a fixed part of the structure (i.e. from the east abutment to 6 feet west of Pier #1).
QCP #5, #8, #10:	Each of these Quality Control Points (QCP) will need two separate sign offs. One prior to applying the coat of paint to ensure proper surface cleanliness and one after applying the coat of paint to ensure proper dry film thickness.
Compressor check:	This is only applicable when performing QCP #3 abrasive blasting or when performing QCPs #5, #8 and #10 if a conventional (non-airless) spray gun is used.
Grit check for oil:	This is only applicable when performing QCP #3 abrasive blasting

CA-S-20 Erection (Demolition) Procedure Checklist

Name (print clearly): _____

Project: _____ Bridge (Co, Rt, Section): _____

Description: _____

Items Inspected:

Plan:

□ Contractor's Erection (Demolition) Plan stamped by two PE's.

□ Contractor's Erection (Demolition) Plan accepted by regulatory agencies, Railroads, Coast Guard, U.S. Army Corps of Engineers, etc., if applicable.

Details:

□ Erection (Demolition) sequence for all members.

□ Maintenance of Traffic during erection (demolition) operations.

□ Location of permanent support structures, roads, railroads, waterways, utilities.

□ Member delivery location and orientation for erection.

□ Member removal location and orientation for demolition.

□ Location and radius of each crane during each pick.

□ Location of crane support (barges, mats, etc.) , during each pick.

□ Crane capacities shown for each crane configuration and boom length used.

□ Lifting weights of primary member picks, including all rigging.

□ Rigging weights, capacities, and arrangements for primary member picks.

□ Locations of the centers of gravity and lifting points for primary members.

□ Temporary supports or bracing.

□ Blocking for bridge bearings.

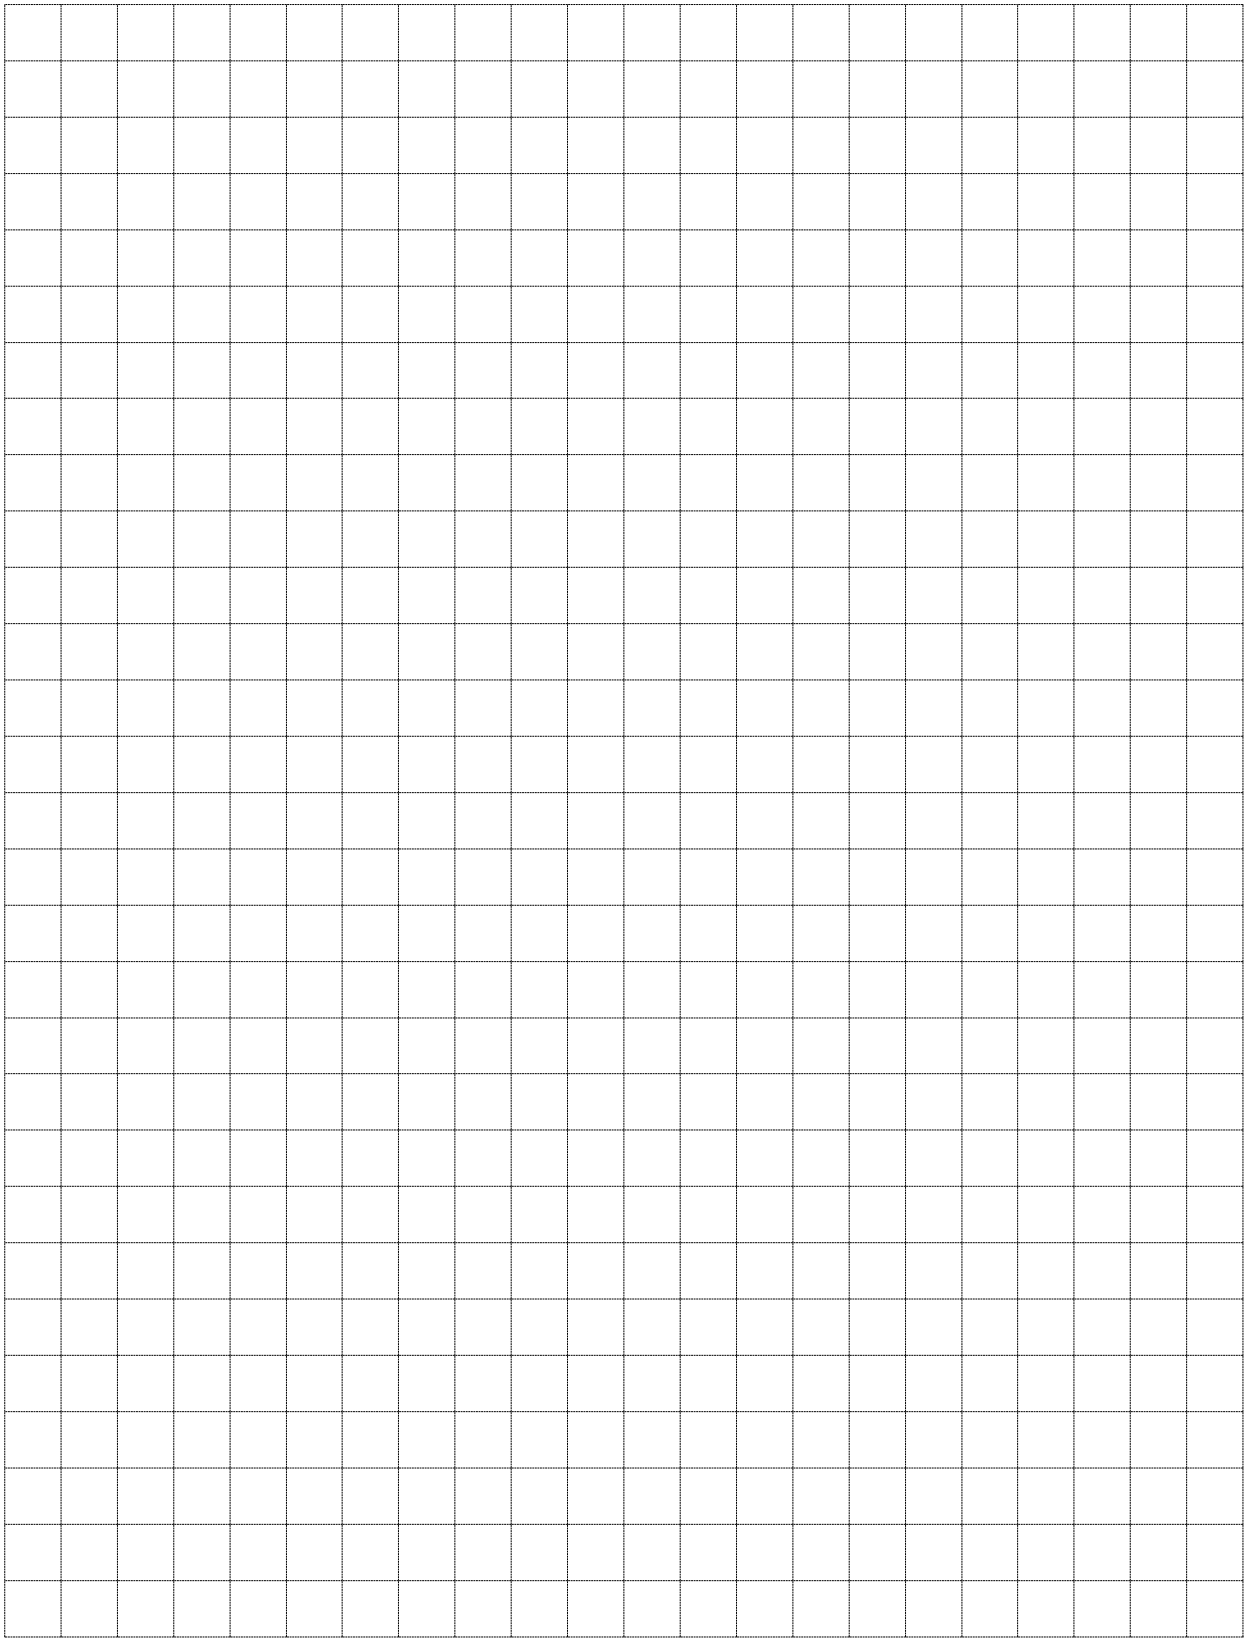
Calculations:

□ Load capacity and stability of crane(s), temporary supports and rigging for each pick and release.

□ Structural adequacy and stability of members for each erection (demolition) step.

Signature: _____ Date: _____

CA-S-20 Erection (Demolition) Procedure Checklist (back)



CA-S-21 Sealing of Concrete Surfaces Checklist

Name (print clearly): _____
Project: _____ Bridge (Co, Rt, Section): _____
Description: _____
Items Inspected:

Storage:

□ Thermometer to check for manufacturer's acceptable range

□ Sealer stored not frozen nor in sun

□ Shelf life

Submittals made:

□ Technical and application data

□ Material Safety Data Sheet

□ 100 Grit Sandpaper supplied by Contractor for comparison

Equipment for proper preparation:

□ Correct water blast equipment (7000 psi minimum)

□ Correct abrasive blast equipment (followed by cleaning)

Equipment mixing and application:

□ Equipment meets manufacturer's requirements:

Surface Preparation, clean concrete with 100 grit sandpaper texture:

□ Test site set up

□ Test all surfaces, (not just vertical)

□ Surface checked for texture

□ Acid Test performed if curing compound used

Mixing:

□ Material used within manufacturer's shelf life □ Mix time and pot life marked

□ Mixed per manufacturer's recommended procedures

Application:

□ Conditions acceptable

□ Material applied within pot life

□ Minimum coating rates met in test sections

- Epoxy – 120 Ft^2/gal, (150 Ft^2/gal if authorized)
- Urethane - 200 Ft^2/gal,(even coverage, no skips or sags)
- Non-Epoxy – 100 Ft^2/gal, Decks, 125 Ft^2/gal, Vert. Surfaces

CA-C-2 QC/QA Concrete QCP Checklist – 1/4

Project No.: _____ Co./Rt./Sec.: _____

Contractor: _____

Submission Date: _____ Original Approval Date: _____

A. Basic Information

	1.	The name and location of the Department inspected and approved concrete producer.
	2.	The Department accepted Job Mix Formula (JMF) to be used for each item.
	3.	The name and accreditation of the AMRL Accredited Laboratory to be used for testing the strength samples for structures or pavements.
	4.	Name of the person(s) who is responsible for compliance with the QCP; acting as liaison to the Department; reporting any non-specification test results and assuring that adjustments are made to remedy problems.
	5.	Names of all technicians who will perform plant or field site inspection, sampling and testing. Use ACI Grade I certified technicians to perform concrete sampling and testing. Provide copies of their ACI certificates.
	6.	Calibration records of test equipment to be used on the project.
	7.	Develop and provide example forms for reporting QC test results to the Engineer conforming to 455.03.C or 455.04.G.

CA-C-2 QC/QA Concrete QCP Checklist - 2/4

B. Minimum Quality Control at the Concrete Source

	1. Verify that the material sources are certified for the type of work in which they are to be used.
	2. Verify that aggregates, cementitious materials and admixtures sources and design weights match the proposed JMF.
	3. Describe how aggregates will be hauled, stockpiled and handled to minimize segregation, avoid contamination, and assure a uniform gradation.
	4. Describe procedures and frequency used to control and measure aggregate moistures.
	5. Provide the batching sequence and mixing procedures to be used to assure that material balling does not occur.
	6. Describe how adjustments to the SSD aggregate design weights in the JMF are made to compensate for moisture contained in the aggregates during batching.
	7. Describe how adjustments to mix water will be made to compensate for aggregate moistures to assure the JMF's water-cementitious ratio (W/Cm) is not exceeded.
	8. Define how the batching tolerances of 499.06 are assured.
	9. Provide the information reported on the batch ticket and how it will be validated that it meets the requirements of 499.07.
	10. Describe the method and frequency of assuring that the combined aggregate gradation remains within Zone II of the Coarseness Factor Chart. If adjustments are made to the JMF proportions, provide the individual aggregate gradations, combined aggregate gradation, and verification that the proportions remain within Zone II of the Coarseness Factor Chart to the Engineer prior to placement.
	11. If using a non-potable water source, describe the procedures and frequency to verify that the water meets the requirements of ASTM C1602. a. If a reclaiming system is used, describe the method and frequency of testing to ensure that the water contains no more than 0.06% chlorides.
	12. Describe how and when the water is removed from the mixer prior to batching a new load of concrete.
	13. Describe methods to verify that the storage and dispensing methods for the admixtures comply with the manufacturer's recommendations.
	14. Describe methods to keep the concrete temperature within specifications and how to mitigate effects of changes to the set time.
	15. Define the desired slump and tolerance for concrete in each construction item.
	16. Define the acceptable yield range, testing frequency to verify that the concrete is maintained within the range.

CA-C-2 QC/QA Concrete QCP Checklist - 3/4

C. Additional Quality Control Plan Requirements for Concrete Pavement

	1. In the QCP define the lots for the project. The Engineer will approve the lot division.
	2. Provide the placement sequence and placement widths for the pavement work and determine the sublot division conforming to Supplement 1064. Provide the Engineer the proposed sublots. The Engineer will approve the sublot division.
	Material Control Requirements
	1. Check the aggregate stockpile conditions, gradation and moisture condition daily. a. Provide the name and OAIMA Level II certification of the person(s) performing the aggregate gradation. b. Define the methods of reporting results to the Engineer including whether the concrete aggregate proportions still conform to the mix's well graded requirements.
	2. For portable plants, assure that the plant is inspected by the Department prior to placing concrete. Describe the procedures and frequencies to verify the mixer blades condition and the scale, gage, meter and admixture dispenser operation.
	3. During paving, perform the following: a. Yield. Define the tolerance and determine the frequency for testing the yield. At a minimum, test the first day of paving, then every fifth day of placement thereafter. b. Air, Slump and Temperature. Sample and test the concrete at least each ½ day of operation at the placement location.
	4. Testing for opening the pavement to traffic early according to 451.18. Describe the methods to be used to assure the modulus of rupture obtains 600 psi (4.2 MPa). Define the methods to report results to the Engineer.
	Pavement Cores for Compression and Thickness. Define at what age the sublot cores for strength and thickness will be taken. Define the age the cores will be tested for compressive strength. Take strength cores at the same location as the cores for thickness determination. Determine sublot core locations according to Supplement 1064.
	1. Pavement Thickness Measurement. Define who will be measuring the pavement thickness according to Supplement 1064. Define the frequency of reporting pavement thickness results to the Engineer. When the sublot core's thickness is deficient, follow the requirements of 451.18 for additional core locations to determine the deficiency's limits.
	2. Define how the Engineer will be provided access to witness the measurements.
	3. Define the method and frequency of reporting pavement thickness results to the Engineer
	Concrete Strength. For each sublot, test the core strengths using an AMRL accredited laboratory.
	1. Propose the method and frequency of reporting the results to the Engineer for acceptance.

CA-C-2 QC/QA Concrete QCP Checklist - 4/4

C. Additional Quality Control Plan Requirements for Concrete Pavement

	Construction Process Requirements
	1. Define the minimum required rate of concrete delivery for continuous placement and assure that the equipment and transportation is adequate to provide the concrete at that rate.
	2. Describe the methods of protecting the concrete in the case of inclement weather.
	3. Describe the methods and frequency of controlling and checking the plastic thickness during paving and reporting issues to the Engineer.
	4. Define fine grading methods and equipment
	5. Define the procedure and frequency of conditioning the subbase or subgrade before pavement placement.
	6. Define who will perform the HIPERPAV analysis required in 451.09 and the proposed timeframe the Engineer will have to review the report.
	7. Describe equipment and methods for consistently delivering and evenly spreading the concrete in front of the paver.
	8. Describe the procedure for dowel bar or load transfer device installation and methods for determining proper placement location after concrete placement. Assure methods conform with 451.09.B.
	9. Describe methods of monitoring the vibrator operation and frequency, time of day, station location and track speed according to 451.05.B
	10. Define materials, methods and controls for curing and joint sealing and assuring application requirements.
	11. Describe joint sawing methods and proposed timing to the sawing operation.
	12. Describe finishing and pavement grooving methods.
	13. Pavement Smoothness. a. Define methods to check pavement smoothness conforming to 451.13 and reporting to the Engineer b. If other smoothness tolerances are required in the contract define the methods to measure, evaluate, and report the results to the Engineer

CA-EW-8 Authorization of Undercuts

Project No. _____ Co-Rt-Sec _____ Date _____

Description _____

Instructions

1. All undercuts to be paid for shall be performed as directed by the Engineer and in accordance with the MOP.
2. Measurements may be made by cross-sections or average length, width and depth, whichever is more appropriate.
3. Furnish material removed, backfill, measurement type and location information.
4. Submit origional copy to District Construction Office immediately. Furnish copy to Contractor if requested.

Material Removed

- ☐ Suitable and used for fill
- ☐ Suitable and wasted
- ☐ Unsuitable

Backfill

- ☐ Material from right-of-way
- ☐ Earth from borrow
- ☐ Granular from borrow

Measurement Type

- ☐ Cross-sections per attached notes
- ☐ Measurements per drawing

Location

_____ Right or Left of centerline

_____ Elevation bottom of undercut

_____

Inspector's Signature Date P.E./P.S. Signature Date

CA-FP-5 Roller Capacity and Placement Rate (back)

Example: Calculate maximum roller capacity and placement rate

A contractor is using one three-wheeled roller, one vibratory roller with 66 inch drums (both vibrating), and one Type 2 pneumatic tire roller to compact a mat that is 5 inches thick.

The material has a Lab Conversion Factor of 2.0 (tons/CY).

From 401.13-1 Roller Capacity Table

Three Wheel Roller (1)	700 SY/HR
Vibratory Roller (1)	2 drums x 66 inches/drum x 15 SY/HR per inch width = 1980 SY/HR
Type 2 Pneumatic Roller (1)	) SY/HR

Calculate Maximum Roller Capacity

700 SY/HR + 1980 SY/HR + 700 SY/HR = **3380 SY/HR**

Calculate Maximum Placement Rate

5 in. x (1 YD/36 in.) = 0.1389 YD

0.1389 YD x 3380 SY/HR = 469.48 CY/HR

469.48 CY/HR x 2 Ton/CY = **938.88 Ton/HR**

If the Contractor is placing 938.88 Ton/HR or less there will be adequate roller coverage.

Example: Check compression roll

A contractor is using a tandem roller with 53 inch width drums. The weight of the roller is 8 tons.

Calculate compression roll:

Compression Roll Lbs/in. = weight of roller (Lbs) / total width of all drums (in.)

= (8 tons x 2000 Lbs/ton) / (2 drums x 53 in.) = **150.9 Lbs/in.**

This compression roll does not meet the requirements of 401.12-2 (200 Lbs/in.)

CA-FP-6 Calculation of Liquid Asphalt Materials

CA-FP-6 Calculation of Liquid Asphalt Materials (back)

Notes:

This formula calculates volume at the specified pay temperature (109.01) for the asphalt material. If the actual temperature, as measured in the tank truck or distributor, differs from the specified pay temperature, the pay volume must be adjusted as per Supplement 1060.

Values for Temperature Factor, ""K"", and Coefficient of Expansion are included in ODOT Supplement 1060, Table A. Table B provides Pay Temperature and an index of formulas to be used for calculating volume based on actual measured temperature."

TE-217 Bituminous Concrete Density Determination - 446 Cores

TE-217 Bituminous Concrete Density Determination - 446 Form Instructions

Day	Day Number (maybe greater than Lot number)
Date Placed	Date asphalt was placed
Beginning Station	Beginning station for the day
Ending Station	Ending station for the day
Width of Sublot	Paving lane width in feet
At Joint? Y or N	Enter Y for joint cores or N for non joint cores (see joint core tab)
Confined or Unconfined Joint?	Enter C for confined or U for unconfined (see joint core tab)
Generate Random Numbers	Use the random number table
Review and Print Form	Use the printed worksheet to layout the cores at paving site

Log into CMS to create a sample ID number and record it on the TE-217 form
Write in tonnage placed for the day in the Quantity box
Make any updates or comments to the form
Make a copy of the TE-217 for the project records
Send in the original TE-217 with cores

TE-217 Bituminous Concrete Density Determination - 446 Cores Instructions

Notes on 446 Density Acceptance and Joint Cores

Each production day = one lot = total tonnage
Each lot is divided into 5 sublots
Take 2 cores from each sublot for a total of 10 cores
Take 3 cold longitudinal joint cores*
Do not locate other mat cores closer than 12" to upper notch (or wedge joint) or vertical face of cold longitudinal join

*** For cold longitudinal joint cores - take 3 cores:**

Take one random core from Sublot 1
Take one random core from the one of the middle three Sublots, 2, 3, or 4
Take one random core from Sublot 5
Randomly determine if joint core is from confined or unconfined joint
See core location table and transverse location diagrams below.

LOCATIONS OF LONGITUDINAL JOINT CORES

Sublot 1		Sublot 2		Sublot 3		Sublot 4		Sublot 5	
Core 1	Core 2	Core 3	Core 4	Core 5	Core 6	Core 7	Core 8	Core 9	Core 10

28	0074	2573	9239	0646	6432	8467	3400	2732	8326	1362	9894	7960	6764	7606	4584	9609	6982
29	0536	6042	1325	6692	6422	4440	7440	4837	9376	3904	4576	6661	3475	4706	6520	3469	3904
30	9192	1264	1864	1179	4305	2676	6259	4039	9722	2209	7150	0645	6891	4024	2416	0784	4696

How to determine random numbers for purpose of determining core locations:

1. Randomly select a starting number from the table.
2. The following number can be the next number in that row or in that column. The choice is purely a matter of preference as long as the chosen method is consistently followed.
3. The number chosen shall be treated as a decimal (If random number = 5241; decimal is 0.5241)
4. For longitudinal core location; multiply the random number by length of sublot and add to the lot's beginning station.
5. For transverse core location; multiply the random number by the width of the sublot.

Example:
Length of sublot = 9000 feet; Width of Sublot = 12 feet; Beginning Station = 0+00; Longitudinal random number = 0.5241; Transverse random number = 0.4621

Calculate longitudinal core location:

0.5241 x 9000 feet = 4716.9 feet

Beginning station = 0+00 = 0 feet; Then core location = 0 + 4716.9 = 47+16.9

Calculate transverse core location:

0.4621 x 12 feet = 5.54 feet from right or left edge of pavement

611.16

* The Department will measure conduit by the number of feet, measured center-to-center of small drainage structures or between open ends including the length of pipe bends and branches. The Department will not deduct conduit length for catch basins, inlets, or manholes where the distance measured in the direction of flow, including bends, is 6 feet or less. Where the location of a drainage structure or an open end is changed with the approval of the Engineer to accommodate full conduit sections, the Department will measure the length placed. Conduits placed on slopes steeper than 3H:1V or with beveled or skewed ends will be measured along the invert.

Remarks: Record problems, soft foundations, under cuts, rock, instructions, utilities encountered, etc. Describe and note location of existing conduits encountered, whether connected, plugged and abandoned, reconnected, etc.

CA-D-9 Daily Concrete Pavement Documentation Form - 1/5

Project: _____ County/Route/Section: _____

Reference #: _____ Item #: _____

Contractor: _____

Station: _____ to _____ Lane: _____

Placement Width: _____ Placement Depth: _____

Date: _____

Temperature and Weather: _____

PCJMF: _____

SUBBASE

Subbase material and condition: _____

Was the subbase thoroughly moistened before placing concrete? _____ (451.06)

Method used to water subbase: _____

JOINTS (451.08)

Longitudinal Joints (451.08A) – Tie Bars

Length: _____ Size: _____ Depth placed: _____

Are tie bars epoxy coated? _____

Method of placing tie bars: _____

Are tie bars being kept horizontal in the slab? _____

Tie bar spacing? _____ Number of tie bars placed per typical panel? _____

Longitudinal joint located at _____ feet from left edge of slab

_____ feet from right edge of slab

CA- D-9 Daily Concrete Pavement Documentation Form - 2/5

Load Transfer Devices (451.08 B) - Transverse Joints

Dowel Length: _____ Diameter: _____ Depth placed: _____

Are dowel bars epoxy coated? _____

Were the dowel bars oiled? _____ Entire bar or alternating ends? _____

Are dowel bars being kept in the proper alignment? _____

Method of placing dowel bars? _____

Dowel bar spacing? _____ beginning _____ from edge of slab

Number of dowels placed per panel? _____ for _____ panel width

_____ for _____ panel width

Transverse joint spacing: _____

Expansion Joints (451.08C)

Dowel Length: _____ Diameter: _____ Depth placed: _____

Are dowel bars epoxy coated? _____

Were the dowel bars oiled? _____

Were expansion sleeves installed? _____

On opposite ends of adjacent dowels? _____

Transverse joint spacing: _____

Construction Joints (451.08E)

Construction joint type: _____

Method of doweling construction joint: _____

Location of construction joint with respect to contraction joint: _____

CA- D-9 Daily Concrete Pavement Documentation Form - 3/5

PLACING CONCRETE (451.06)

Method of Construction – Fixed Form or Slip Formed? _____

Formed Construction

Forms made of steel? _____

Form depth equal to pavement thickness? _____

Forms cleaned and oiled? _____

Slip Form Construction

Slip form paver make/ model: _____

Number of internal vibrators: _____

Vibrator monitors working? _____

Were all vibrators working properly? _____

Vibration frequency range _____ to _____ ipm

Was vibrator information recorded? _____

Method of aligning paver: _____

Paver advancement rate: _____ feet/minute

Is the longitudinal face of the slab being kept vertical? _____

Any projections or ridges exceeding tolerances in 451.03B? _____

Method of depositing concrete:

Is a spreader required/used? _____

Was its use waived? / Reason: _____

CA- D-9 Daily Concrete Pavement Documentation Form - 4/5

FINISHING (451.09)

Hand finishing methods used: _____

Was 10' straightedge used? _____

Were pavement edges rounded? _____

Micro texture type: _____ applied using: _____

Macro texture type: _____ applied using: _____

Tine groove spacing: _____ Tine depth: _____

Were station numbers stamped into the shoulder pavement? _____ Spacing? _____

Station number position: _____

CURING (451.10)

Method of applying curing compound: _____

Curing compound required: Width = _____ (slab width) + 2 x _____ (slab thickness) = _____

Gallons Required = _____ (length) x _____ (width) / 150 = _____

Gallons Used = _____ (begin tank) - _____ (end tank) = _____

Curing compound applied approximately _____ minutes after final finishing

JOINT SAWING (451.08)

Was a HIPERPAV file submitted for this pour? _____

HIPERPAV predicts early age cracking beginning at _____ without joint sawing.

Joint sawing began at _____

Method of sawing: Early-entry saw? _____ Wet Sawing? _____

	Width of Saw Cut	*Depth of Saw Cut*
Longitudinal Joints:	_____	_____
Contraction Joints:	_____	_____

Do not start a new section at 10 miles even if section length exceeds 10 miles.
Whenever material or beads are loaded, end the section, record data for the completed section, reload striper, then begin new section.
Application rates and average thickness and MPH are calculated over the length of the section painted from Start Hwy SLM to End Hwy SLM.
Copy of DLS Report is to be provided to Engineer not later than one day following the application of material to a section of highway.

County	Route Number / Name	Direction	Start Time	Marking Type	Start Hwy SLM	End Hwy SLM	Road Length	Kettle 1 Color	Kettle 2 Color	Line Width	Linear Feet Painted	Equiv Miles Painted	Avg MPH	Bead 1 Lbs Beads Used	Bead 2 Lbs Beads Used	Lbs Beads per 100 Sq Ft	Kettle 1 Temp	Kettle 2 Temp	Matl 1 Temp @ Applic'n Point	Matl 2 Temp @ Applic'n Point	Humidity	Dew Point	Air Temp	Road Surface Temp	Paint1 Batch No	Paint2 Batch No	Bead1 Batch No	Bead2 Batch No

DLS Short Report Format - Thermoplastic System

Project Name	
Date

TE-31 Sample Data

Envelope No: _____

Sample ID: _____ Sample Origin: _____ Personnel ID: _____

Type of Inspection: _____ Date Sampled: _____

P/S Code (1): _____ at _____

Mix Plant Code (1): _____ at _____

Material Code: _____

Brand Name: _____

Description 1: _____ 2: _____ 3: _____

Represents Quantity (2): _____ Unit of Measure:_____

Number of Items: _____ Consigned to: _____

Sampled from: _____ Mfg. Control Number: _____

Responsible Location: _____ Test Lab: _____

Assign To	Project PO	PO Ind	Item Code	Ref No	Quantity

Lot/Day (3): _____ JMF (3): _____

Concrete Cylinder Specimen Numbers (4): _____ Bill of Lading No: _____

Remarks: _____

_____

_____

_____

_____

(1) Same materials are used at a Bituminous or PC Concrete mix plant and are sampled and tested by plant and not by project. For these samples the producer/supplier is identified in the P/S field and the mix plant where the material is sampled is identified in the mix plant field.

(2) Job control samples require a quantity.

(3) Rice and Extraction Samples require a JMF, 411 materials require Lot/Day No.

(4) Identifies concrete cylinders being shipped to the Test lab (TE-31 not to be entered into CIVIS - data already entered from corresponding TE-45)

Noise Barrier Wall Shop Drawing Review Checklist

The purpose of this checklist is to assist the Engineer with the Department's review of shop drawings submitted by the Contractor in accordance with Standard Bridge Drawing, NBS-1-09.

- ☐ The shop drawings are signed, sealed and dated by an Ohio Registered Professional Engineer. See footnote ( ).
- ☐ The Contractor has accepted the shop drawings in writing. See footnote (1).
- ☐ The acceptance letter documents all issues raised by the contractor, fabricator and Department including disposition of issues. See footnote (1).
- ☐ For absorptive walls, the absorptive wall material supplier is a pre-approved supplier in accordance with NBS-1-09 or all certified test data and performance history documentation has been provided and is in accordance with NBS-1-09. See footnote (1).
- ☐ The shop drawing top of wall elevation at each panel meets or is above the plan requirements. See footnote ( ).
- ☐ The shop drawing bottom of wall elevation at each panel meets or is lower than the plan requirements. See footnote (2).
- ☐ The total panel height at each location meets the plan requirements and is consistent with the top and bottom of wall elevations as provided in the shop drawings. See footnote (2).
- ☐ The shop drawing post height at each location meets the plan requirements. See footnote (2).
- ☐ The shop drawing individual panel designs are in accordance with NBS-1-09. See footnote (3).
- ☐ The shop drawing individual post designs are in accordance with NBS-1-09. See footnote (3).
- ☐ The shop drawing wall alignment is in accordance with the contract requirements. See footnote (3).
- ☐ The shop drawing material requirements are in accordance with NBS-1-09. See footnote (3).
- ☐ The shop drawing aesthetic treatments are in accordance with the contract requirements, including alignment of horizontal joint lines for at least 96-ft. See footnote ( ).
- ☐ The shop drawing base plate and anchor bolt requirements are in accordance with NBS-1-09. See footnote (3).

If all checklist items are met, mark documents as "ACCEPTED".

Footnotes:

1. If missing, mark documents as "NOT ACCEPTED".
2. Document all discrepancies and mark documents "ACCEPTED AS NOTED". Resubmittal is not required.
3. Document all discrepancies and mark documents "ACCEPTED AS NOTED – RESUBMIT".

Preconstruction Meeting Agenda/Minutes

Attach signed attendance sheet with Name/Representing/Phone

Date of Meeting: _____ Location: _____
Name of Project Engineer: _____
Name of Area Engineer: _____
Designer of Record: _____
State Project No: _____, C-R-S: _____, PID: _____
Project Type / Description: _____
Bid date: _____ Awarded date: _____ Completion date: _____
Estimate dates: _____ and _____ of each month,
accepted payroll and certification of estimates is required (109.09)
Field Offices: _____

Public Relations: _____
_____
Distribute and discuss all applicable contract documents: _____
_____
_____
Explanation of Scope and Future Intents (if any): _____
_____
Safety Requirements and Protocols: _____
_____
_____
Emergency Information: _____
_____
Status of Utilities, Right of Way, RR and Local requirements: _____
_____
_____
Discussion of all DBE Goals/EEO/Prevailing Wage Requirements: _____
_____
_____
Protection and Restoration Provisions: _____
_____

CA-G-1 Preconstruction Meeting Agenda / Checklist - 2/3

Prime Contractor: _____Phone No: _____
Superintendent: _____Phone No: _____
Normal Work Hours: _____ to _____ Weekdays
Normal Work Hours: _____ to _____ Weekends
Expected Construction Start Date: _____

Environmental permit and SWPPP requirements and commitments: _____
_____
_____
Erosion Control and Best Management Practices discussion: _____
_____
_____
Initial Schedule received? _____ (Bar Chart or CPM)
Review of the Schedule: _____
_____
Partnering: _____
_____
Review of the Disputes and Claims Process: _____
_____
Review of the Change Order Process: _____
_____
Time Extensions: _____
_____
Force Account: _____
_____
Price Adjustments: _____
_____
Locations, Dates, and Descriptions of major work phases: _____
_____
_____
Haul roads designated: _____
_____
_____
Borrow/ Waste/ Agreements: _____
_____
_____
List Subcontractors to be used: _____
_____

CA-G-1 Preconstruction Meeting Agenda / Checklist - 3/3

AC / PCC plants to be used: _____
_____
_____

List of major material suppliers: _____
_____
_____

Material approval, inspection, and payment processes: _____
_____
_____

Bridge Related Items/Issues: _____
_____
_____

Maintenance of Traffic: _____
_____
_____

Other Traffic Related Items: _____
_____

Final Inspection/Punch List Requirements: _____
_____

Progress Meetings frequency: _____

Contractor Evaluation and C-95: _____

Other items for Discussion:
_____
_____
_____
_____

Distribute the Preconstruction Minutes with all attachments to: Project Engineer, Prime Contractor Superintendent, Designer, Construction Office, LPA, and others expressing interest.
